The name was introduced by Radophi for worms previously known under the name of *Acanthodes*, a term afterward used in a much restricted sense. Most of these worms are endoparasitic at one or another stage of their life or during the whole of it; those which are not are mostly of minute size. There are several distinct families, and most of them have popular names. Thus the *Ascaridae* contain the roundworms and pinworms of the human rectum. The *Strongylidae* or strongyles are parasites of various parts of the body, like the *Trichostrongylidae* or meadow worms. The *Pharyngidae* are the guinea-worms. The name plant, to which Dawson later gave the name of *Nematophyton*, was examined by Carruthers and placed among the *Algae*, he considering it an anomalous alga and one which it was not possible to correlate with certainty with any known alga. Later (in 1875) the same plant was discovered by Hicks much lower in the geological series, namely, in the Devonian shales of a rock occupying a rather uncertain position, but probably near the limit between Upper and Lower Silurian. The specimens from this position have been identified with the *Nematophyton* of Carruthers (the *Protolaxia* of Dawson) by Etheridge, who considers it as unquestionably forming a portion of a colonial seaweed, whose habits resemble those of the North Pacific species of the genus *Nematocystis* and the arborescent *Leanoria*.

These games were celebrated at Nemea in the second and fourth years of each Olympiad, near the temple of the Nemean Zeus, some (Doric) columns of which are still standing. According to the mythological story, the games were instituted in memory of the death of the young hero Archemorus or Opheltes by the bite of a serpent as the expedition of "the Seven against Thebes" was passing through the place. They were formerly classed with the platyhelminths, and known as the *rhynchocoelous turbellarians*; but they are more nearly related to annelids. They have well developed muscular, blood-vascular, and nervous systems. Most of the species are dioecious, and some are viviparous. There are commonly villated pits on the head. The object known as a *plutonium* is the free-swimming larva of a nemertean. These worms vary greatly in general outward aspect, in size, and in habits. Some are minute, others very long. (See *Lineidae*.) They live for the most part in the sea, but some live in the mud or on land, and some are parasitic. The *Nemertes* are often divided into two orders, called *Anguila* and *Knopea* according as the proboscis is armed with stylets or unarmed. Of the latter order is the family *Nemertidae* (or *Amphipodidae*); the *Lineidae* and *Cephalothoracidae* are an ophiuran. It was her special function to see that the proper proportion of individual prosperity was preserved, and that any one who became too prosperous or was too much afflicted by his prosperity should be reduced or punished, she thus came to be regarded as the goddess of divine retribution. Sometimes Nemesia was represented as winged and with the wheel of fortune, or borne in a chariot drawn by griffins, and confounded with *Atracata*, the goddess of the inevitable. 2. Figuratively, the ocean.

Ye that on the sands with printless foot
Do chase the ebbing *Neptune*.
Shak., Tempest, v. 1. 35.

3. In *her.*, same as *Triton*.—4. The outermost known planet of the solar system, and the third in volume and mass, though quite invisible to the naked eye. It was discovered in the autumn of 1846. Uranus, the planet next to Neptune, revolving about the sun in eighty-four years, was discovered in 1781, but observations of it as a fixed star were scattered through the eighteenth century. In 1821 Bouvard found that the observations of Uranus could not be satisfied by any theory based on the gravitation of known bodies, and hinted at an undiscovered planet. During the following twenty years further observations satisfied astronomers that such a planet must exist. To find where it could be was the problem which two mathematicians, J. C. Adams in England and U. J. J. Leverrier in France, set themselves to solve by mathematics. The calculations of Leverrier assigned the boundaries of a not very large region within which the unknown planet might be. In consequence of the indications of Adams, the astronomer Challis observed the planet Neptune August 4th and 12th, 1846, but, neglecting to work up his observations, failed to recognize it as a planet, while, in consequence of the indications of Leverrier, Galle of Berlin discovered Neptune September 23d, 1846. The orbit of the new planet, having been determined from direct observations, was found to differ excessively from the predictions in all its elements; so much so that Leverrier declared these elements "incompatible with the nature of the irregular perturbations of Uranus." The distance from the sun was 30 times instead of 26 times that of the earth, as predicted; and the orbit, instead of being more elliptical than that of any planet except Mercury, was in fact the most circular of all. When Neptune was discovered by Dr. Galle it was only 1° from the predicted place; but this would not have been so at the epoch to which the calculations referred, and there was nothing in their nature to render them particularly accurate for 1846, so that this coincidence should be regarded as in great measure a happy accident, such as would occur by mere chance once in 180 times. A satellite to Neptune was detected in October, 1846, by Lassell. Its period of revolution is 5 days, 21 hours, and 8 minutes, and its maximum elongation 18". The mass of Neptune, having been calculated from these data, was found to be 1/45th that of the sun, against predicted values nearly twice as great. With the mass so ascertained, the perturbing action upon Uranus was calculated, and found to satisfy the observations of that planet much better than either Leverrier's or Adams's hypothesis had done. This was because the real action of Neptune upon the orbit of Uranus was of a different kind from what it had been assumed to be, those terms of the mathematical expressions which had been assumed to be the principal ones being really insignificant, and those which had been neglected as insignificant being really the controlling ones. The name *Neptune* was conferred by Encke, Leverrier having signified that he wished it called by his own name. The diameter of Neptune is 37,000 miles. Its distance from the sun is about 2,900,000,000 miles, and its period of revolution about 104 years. Neptune's horse, a fish of the family *Hippocampidae*; a sea-horse. The word is used especially to designate an aqueous origin of certain formations, now generally admitted to be volcanic, but which according to the views of Werner were deposited from water. (See *Huttonian* and *Wernerian*.) A most violent discussion in regard to this subject was carried on, during the latter third of the eighteenth century, by geologists and theologians.

II. *a.* (Of, pertaining to, or advocating the Neptunian theory.)

In *Gr. myth.*, a sea-nymph, one of the daughters of Nereus and Doris, generally spoken of as fifty in number. The most famous among them were Amphitrite, Thetis, and Galathea. The Nereids were beautiful maidens helpful to voyagers, and constituted the main body of the female, as the Tritons did of the male, followers of Poseidon or Neptune. They were imagined as dancing, singing, playing musical instruments, wooed by the Tritons, and passing in long processions over the sea seated on hippocamps and other monsters. Monuments of ancient art represent them lightly draped or nude, in poses characterized by undulating lines, harmonizing with those of the ocean, and often riding on sea-monsters of fantastic forms.

That, moving, moves the nest and nestling.
Tennyson, *Sea Drums*.

Whom more injurious Nature later brings
Into the naked world. *Sp. Hall, Satires, II. 13.*

II. *a.* Being still a nestling; being yet in the nest.

I have educated nestling finches under the three best singing larks.
Barrington, *Experiments on Singing Birds*. (*Encyc. Brit.*)

Nestor (nes'tor), *n.* [*NL. Nestor, < Gr. Nestor*, in Greek legend a king of Pylos in Greece, the oldest of the chiefs who took part in the siege of Troy.] 1. The oldest and wisest (because most experienced) man of a class or company; in allusion to Nestor in Greek legend. Hence—2. A counselor; an adviser.—3. In ornith., a genus of parrots having a remarkably long beak; named from the gray head. *Nestor notabilis* is the New Zealand kakoi; *N. productus* is another species. There are several others, some recently extinct.

Nestorian (nes-to'ri-an), *a.* and *n.* [*< L.L. Nestorianus, < Nestorius, Gr. Nestorikos, Nestorius* (see def.).] 1. *a.* Of or pertaining to Nestorius (see *Nestorianism*), or the Nestorians or their doctrine.

The people are of sundry kinds, for there are not only Saracens and idolaters but also a few Nestorian Christians.
Encyc. Brit., XXIV, 769.

Nestorian liturgy. See *Liturgy*, 3 (2).
II. *n.* 1. A follower of Nestorius; one who denies the hypostatic union of two natures in one person in Christ, holding that he possesses two distinct personalities, the union between which is merely moral. After the Council of Ephesus the Nestorians obtained possession of the theological schools of Edessa, Sisibis, and Seleucia, and were driven by imperial edicts into Persia, where they finally established themselves. Later they spread to India, Arabia, and as far as China. About 1400 the greater part of their churches perished under the persecutions of Timur, and in the sixteenth century a large part of the remainder joined the Roman Catholics. These are called *Chaldeans*. See def. 2, and *Nestorianism*.

2. One of a modern Christian body in Persia and Turkey, the remnant of the once powerful Nestorian denomination. They number about 140,000, are subject to a patriarch (the patriarch of Urubah) and eighteen bishops, recognize seven sacraments, administer communion in both kinds, and have many facts. Another community of Nestorian origin still exists on the Malabar coast of India, but since the middle of the seventeenth century these are said to have become Monophysites. See *Christians of St. Thomas*, under *Christian*.

The Persian kings were always more favourable to Nestorians, as believing them to deny the True Divinity of our Lord.
J. M. Neale, *Eastern Church*, I, 112.

Nestorianism (nes-to'ri-an-izm), *n.* [*< Nestorian + -ism*.] In *theol.*, the doctrine that in the God-man the two natures, the divine and the human, are not united in one person, and that consequently he possesses two distinct personalities. Nestorianism is at the opposite extreme of Christological doctrine from Monophysitism. It derives its name from Nestorius, patriarch of Constantinople in the fifth century, who was condemned by the third and fourth oecumenical councils (that of Ephesus in 431 and that of Chalcedon in 451) as promulgating teachings which involved this doctrine and as refusing to assent to the decision of the Ephesine Council. See *Philotheus*.

As Eutychianism is the doctrine that the God-man has only the one nature, so Nestorianism is the doctrine that he has two complete persons. *Encyc. Brit.*, XVII, 60.

The celebrated school at Edessa remained firm against the Arian heresy, but gave way to Nestorianism about the time of Zeno.
J. M. Neale, *Eastern Church*, I, 127.

net¹ (net), *n.* and *a.* [*< ME. net, < AS. net, nett* = *OS. netta, net* = *OPries. netta, netta* = *D. net*

= *MLG. netle* = *OHG. nazi, nazi*, *MHG. netze*, *G. netz* = *Isel. net* = *Sw. nät* = *Dan. net* = *Goth. natti*, a net; cf. *Isel. nät*, a large net. Root unknown.] 1. *n.* 1. An open textile fabric, of cotton, linen, hemp, silk, or other material, tied or woven with a mesh of any size, designed or used for catching animals alive, either by inclosing or by entangling them; a netting or net work used as a snare or trap. Nets are of high antiquity, and there are almost as many kinds of them as there are ways in which a piece of netting or a network can be adapted to the capture of animals. It is characteristic of nets to take the game alive, either by surrounding or inclosing it as in a bag or by entangling it in meshes. Many kinds of net are described and named from the nature of the game, as, *bird-net*, *butterfly-net*, *fish-net*; from the way in which the game is taken, as, *gill-net*, *gill net*; from the way in which the net is handled or worked, as, *heating-net*, *drop-net*, *drag-net*, *drift-net*, *drag-net*, *haul-net*, *hand-net*, *net*, *net*, *net*, *net*, *net*, etc.; from the shape of the netting, as, *bag-net*, *purse net*, etc. In the fisheries in which nets are most used, many of them take other names, as *ake*, *poned*, *seine*, *veit*, *trap*. (See these words and the above compounds.) Nets range in size from a few inches to a mile or more; thus, seines have been made reaching with the ropes which haul them 5 miles, and sweeping more than 1,000 acres of water-bottom. The material ranges from the finest silk, muslin, etc., to stout cordage, gut or straw in some instances used. The mesh is always made with a fixed, not running, knot. The appliances of nets are numerous; as, buoys or buoy-lines to float one border of the net or indicate the whereabouts of a net under water, sinkers, leads, or lead-lines to sink one border of the net to the bottom of the water, cords or ropes for setting, stretching, hauling, pursuing, etc., often worked by mechanical contrivances, as a winch used operated by horse or steam power, poles or stakes for setting, etc. In some kinds of nets or weirs the staking or paling is so extensive in comparison with the netting that the contrivance is converted into a wooden trap, and is, in fact, called a *trap*. See *net*, *s. t.*, 2.

But as a bird, which will alight
And as the net, but nought the nettle.
Gower, *Conf. Amant* in
And nets of various sorts, and various snares,
The seine, the cast net, and the wicker maze,
To waste the watery tribes a thousand ways.
Fairfax, *l.*, of *Idylls of Theocritus*, xxi.

2. Figuratively, a snare or device for entrapping or ensnaring in any way; a moral or mental trap or entanglement.

Hue were lapt by the net so bryd is in snare.
Flemish Lamentation (Child's Ballads, VI, 272)
So will I turn her virtue into piteh.
And out of her own goodness make the net
That shall enmesh them all.
Shak., *Othello*, II, 3, 365.
Skill'd to rethe, and in retching draw
Hearts after them tangled in amorous nets.
Milton, *P. R.*, II, 162.

3. A light open woven fabric, as gauze or muslin, worn or used as a protection from annoying insects; as, a mosquito-net spread over a bed.—4. Machine-made lace of many kinds. The varieties of machine net formerly made were *chip-net*, *mind net*, *pat net*, *dry-net*, *spider net*, *balloon net*. The modern varieties named according to the kind of mesh employed, are *carpet-net*, *point net*, and *bobbin net*. *Brood net* is woven as wide as the machine will allow. Quillings are narrow widths, several being made at one time in the breadth of the machine. *Fancy net* has a gump pattern worked in by hand called *lace darning* or by the Jacquard attachment.

Here's a bit o' net then for you to look at before I tie up my pack. . . spotted and speckled, you see, beautiful, but yellow. . . (Shak., *Hamlet*, IV, 1, 170.)
George Eliot, *Mill on the Floss*, v, 2.

5. A light open meshed bag for holding or confining the hair. Some are made of threads so fine that they are called *invisible nets*.

The hair is usually plaited down on each side of the face and inclosed in a net or cowl.
Encyc. Brit., VI, 470.

6. Anything formed with interstices or meshes like a net.

Vote of checker work, and wreaths of chain work, for the chapters.
1 Kl. VII, 17.

Tennyson, *Lancelot and Guinevere*.

7. In *anat.* and *ool.*, a reticulation or cancellation; a network of anastomosing or inosculating filaments or vessels; a web or mesh; a rete.—8. In *math.*, a retilinear figure drawn as follows. For a plane net, four points in a plane are assumed, and through pairs of them and of points subsequently obtained as intersections of lines straight lines are drawn. For a net in space, five points are assumed, through triads of which, and of points subsequently obtained as intersections of three planes, planes are drawn.

Bag-and-stake net. A kind of net with similar to that form of seine sometimes used to take bluefish. In England the bag and stake nets are included in the law forbidding the use of fixed engines for the capture of salmon. *Massachusetts Report* (1865), p. 28.—**Baird net.** A form of collecting net; named from its designer, Prof. S. F. Baird.—**Bar-net.** That part of a stake-net which is hung on stakes in a bay at right angles with the shore, and with which the fish first come in contact. See *stake-net*, *it* (anad.).—**Brussels net.** (a) The pillow-made ground of Brussels application lace. (b) A machine-made ground

imitating the above.—**Bull-net.** A large dip-net worked from the rigging by block and tackle, and used in hauling a purse-seine.—**Cast-net.** A fishing-net consisting of a circle of netting varying in diameter from 4 feet to 15 or more. To its circumference are attached, at short intervals, leaden weights. There is a central opening, usually constituted by a ferrule of bone or metal. One end of a long rope passes through this ferrule, and to it are attached numerous cords extending to the lead-ropes. The net is used by gathering up the casting-rope in a coil on one arm, and taking the net itself on the other. By a dexterous fling of the arm holding the net, this is thrown in such a way as to spread out completely, and it is sometimes hurled to a distance of many feet, so as to fall flat on the surface of the water. The lead sink immediately forming a circular inclosure, and imprisoning any fish that happen to be under it at the time. The rope is then hauled in from the other end, causing the whole circumference to pucker inwardly, the lead and pucker coming together in a compact mass. These nets are extensively used in the West Indies and the southern United States.—**Cast-net.** A fishing-net that is cast.—**Casting-net.** A net spread over a cherry tree to keep off birds.

To catch a dragon in a cherry net,
To trip a tiger with a gossamer,
Were wisdom to it.
Tennyson, *Princess*, v.

Glue-net. A purse seine. (New Jersey.)—**Collecting-net.** A small seine used for collecting fish for specimens of natural history; a collecting seine.—**Darned net.** A net of any kind, embroidered with either white or colored thread of any material. It differs from *darned embroidery* in giving less solid and uniform opaque surfaces, and in depending more upon the outline formed by a single thread carried through the meshes. See *darned netting* under *netting*.—**Diving-net.** A net arranged somewhat like a fyke, for taking rock fish, perch, etc. (New Jersey.)—**Draft-net.** A haul seine. (New Jersey.)—**Drag-net.** A small seine dragged or hauled in shallow water, one end of the net being fastened in the mud by means of the staff. The drag-net is from 75 to 100 yards long and 25 to 37 inches deep, with a mesh of from 1½ to 2 inches. The lead-line is provided with heavy lead sinkers, the cork line with floats.—**Dredge-net.** See *dredge*.—**Drift-net.** A fishing net which drifts with the tide. Drift nets are arranged on the same principle as gill nets (see *gill net*), except that they are allowed to drift about with the tide instead of being secured to stakes. They are shot or paid out from boats in a straight line, and kept perpendicular by buoys along the top and leads at the bottom, and are drawn out straight across the current by a boat rowed in the proper direction.—**Dutch net.** A pound net. (North Carolina.)—**Gang or hook of nets.** See *gang*.—**Glade net.** See *glade-net*.—**Maltese net.** In *lace making*, a ground or design in which the Maltese cross appears, especially one consisting of octagons, each enclosing a Maltese cross, and alternating with elongated hexagons and small triangles, producing a very complex pattern. Run net, darned netting of a simple sort in which the needlework is not elaborately stitched. A. S. Gode, *Embroidery and Lace*. To run the net, to feel for fish that may have been caught, by handling the cork line of a net without further disturbing its set in the water, run the cork-line hand over hand. The struggling of the fish is readily felt in this way, and they are ungilled as soon as possible that they may not injure themselves nor be devoured by other fish. Water-net, a fresh-water alga, *Hydrodictyon utriculatum*. See *Hydrodictyon*.

II. *a.* 1. Made of netting; as, a net fence.—2. Resembling netting; having a structure which is like netting—that is, one which has open meshes, large in proportion to the thickness of the threads.—3. Caught in a net; netted; as, net fish.—4. Reticulate or cancellate; netted or net-veined, as an insect's wings.—**Net embroidery.** (a) Decorative needlework done upon net as a foundation. (b) Decorative work done upon net, but not strictly needlework, as muslin appliqué (which see, under *muslin*).—**Net-mackerel.** See *mackerel*.

In medieval times the vestments of the clergy frequently had *netted* coverings of silk.
Drapers' Dict., p. 229.

2. To capture or take with a net, as game; ensnare, entangle, or entrap in or by means of network, as any animal. Quadrupeds are not often netted, traps or snares or guns being commonly used for their capture. Birds are netted in several different ways: by springing a net over them, by driving them into a winged and tunneled net, as ducks, by the use of a hand net on a pole, as in taking insects; and by entangling them in the meshes of a spread net. Fishes, including shell-fish, are netted by every device which can be put into effect by means of network. The use of the net in these cases is, however, in one of two leading methods, entangling and inclosing. In the former of these, the fish swims against a vertical sheet of netting, finds the mesh too small to go through, and is caught by the gills in trying to back out. Insects are netted by collectors in one of two ways: with the butterfly-net, which is a very light bag of silk, gauze, etc., on a frame and pole; and with the beating-net, a bag of stout cloth or light canvas on a frame, with a short handle, used to beat or brush the grass and bushes. See *net*, *n.*

3. To take as if with a net; capture by arts, wiles, or stratagems; entangle in difficulty; beguile.

And now I am here *netted* and in the coils. *Shak.*

4. To put into or surround with a net for protection or safe-keeping; hold in place by means of a net, as one's hair; veil or cover, as

the land with a net; spread a net over or around, as a fruit-tree to keep off the birds, or a bed to keep out mosquitoes.

To leave his favourite tree to strangers, after all the pains he had been at in setting it to keep off the birds.

3. Lowest; not subject to further deduction or discount: as, these prices are *net*. — **Net measure**, in architecture, measure in which no allowance is made for finishing. In the work of artificers, measure in which no allowance is made for the waste of materials. — **Net proceeds**, the amount or sum left from the sale of goods after every charge is paid. — **Net profits**, what remains as the clear gain of any business adventure, after deducting the capital invested in the business, the expenses incurred in its management, and the losses sustained by its operation. — **Net stock**, the net proceeds of a fishing trip after all expenses have been deducted. — **Net weight**, the weight of merchandise after allowance has been made for casks, bags, cases, or any inclosing material.

* **net**³ (net), *v. t.* pret. and pp. *netted*, pp. *netting*. [*net*², *a.*] To gain or produce as clear profit: as, to *net* a thousand dollars in a business transaction; the sale *netted* a hundred dollars.

It was originally composed of the genera *Libellula*, *Ephemer*, *Phanocera*, *Hemerobius*, *Myrmecoleon*, *Panorpia*, and *Raphidia* (*Raphidius*). The winged termite-like insect included in *Hemerobius*. The group thus constituted has suffered many changes, and entomologists are still far from agreed upon its proper definition. Fabricius included a distinct order *Coleoptera* for the Linnaean *Libellula* or dragon-flies. Kirby separated the Linnaean *Phanocera* or scud-like flies under the ordinal name *Trichoptera*. Stålman founded the order *Pseudoneuroptera* for those Linnaean neuropters whose metamorphosis is in-

complete and whose pupae are active. These distinctions left the *Neuroptera* to consist of the families *Scorpion*, *Hemerobidae*, *Hexagenidae*, *Myrmecoleonidae*, and *Panorpidae*. By some authors the *Phryganeidae* (the *Trichoptera* of Kirby) are still assigned to *Neuroptera*, though M. Lachm. Brauer, and others exclude them. The last-named authority has the largest following in restricting the order *Neuroptera* to the four families *Scorpionidae*, *Hemerobidae*, *Hexagenidae*, and *Myrmecoleonidae*, forming a separate order *Neuroptera* for the family *Panorpidae*, and leaving the *Trichoptera* out as a separate order. In this restricted sense the technical characters of the *Neuroptera* are—wings four in number and reticulate; labial palpi three jointed, the joints free, mandibles free; pupae distinctly mandibulate; and larva as in *Myrmecoleon*. These insects are all carnivorous in the larval state, and are either aquatic or terrestrial, the aquatic forms pupating terrestrially. See *cuts* under *Chrysope*, *Mantis*, and *nerure*.

It is not a departure from neutrality to furnish to either of the contending parties supplies which do not fall within the description of contraband of war—that is, arms and munitions of war, and things out of which munitions of war are made.

neutralization (nū'trāl-i-zā'shən), *n.* [*Fr.* *neutralisation*; as *neutrative* + *-ation*.] 1. The act of neutralizing; specifically, in *chem.*, the process by which an acid and a base are so combined that the resulting compound has neither acid nor basic properties. Thus, if a solution of sodium hydroxide is carefully added to sulphuric acid, the acidity of the mixture grows less and at length quite disappears, leaving the mixture with neither acid nor basic properties. This is the *neutralization* point. If more sodium hydroxide is added, it imparts a basic or alkaline property to the mixture. *Neutralization* can then be brought about only by addition of an acid. In these cases the acid and base are said to *neutralize* each other. The same *neutralization* is also given to the decomposition of alkaline carbonates by the addition of some stronger acid in quantity just sufficient wholly to displace carbonic acid.

There are some cases in which the *neutralization* is effected by the addition of a substance which, even if added in excess, produces a precipitate, and so leaves the solution neutral, so that the addition of an excess of the precipitant is without much importance.

Lea, Photography, p. 428.

2. (a) An act of one or more nations imposing upon one of their number or upon another state a condition of permanent neutrality by ordaining that it shall not take part in any war into which the others may enter, in consideration for which its freedom from attack is usually guaranteed, as in the case of Switzerland in 1815, and Belgium since its separation from the Netherlands in 1830. (b) An act of military powers agreeing that certain persons, property, and places, such as surgeons, chaplains, and the wounded, medical supplies, hospitals, and ambulances, shall be deemed neutral in war, and not subject to capture, etc., as was agreed by the Geneva Convention, 1864. (c) More loosely, the act of securing by convention immunity

for certain territory or waters from being made the scene of hostilities or of exclusive national maritime jurisdiction, as for the Black Sea, 1856, and for the Congo in Central Africa, 1885. (d) The condition of immunity and restriction resulting from any of such acts.

Also spelled *neutralisation*.

neutralize (nū'tral-iz), *v. t.*; pret. and pp. *neutralized*, ppi. *neutralized*. [*= F. neutraliser = Sp. P. g. neutralizar = It. neutralizzare*; *ne* *neutral* + *-ize*.] 1. To render neutral; reduce to a state of neutrality between different parties or opinions. Specifically—(a) To bestow by convention a neutral character upon (states, persons, and things which would or might otherwise bear a belligerent character); declare non belligerent. (b) To prohibit hostilities within the limits of, as territory or waters.

The articles of the treaty which referred to the Black Sea is of especial importance. "The Black Sea is *neutralized*; its waters and its ports, thrown open to the maritime commerce of every nation, are formally and in perpetuity inducted to the flag of war of either of the Powers possessing its coasts or of any other Power." *J. McCarthy, Hist. Own Times, xxviii.*

2. In chem., to destroy or render inert or imperceptible the peculiar properties of, by chemical combination. See *neutralization*, 1.

Ammonia *neutralizes* the most powerful acids, and forms a very important class of salts. *W. A. Miller, Mem. of Chem., 4 369.*

3. To render inoperative; invalidate; nullify; counterbalance; as, to *neutralize* opposition.

He acts as Archimedes would have done if he had attempted to move the earth by a lever fixed on the earth. The action and reaction *neutralize* each other.

Macaulay, West. Kowles's Def. of Mill.

As one poison will sometimes *neutralize* another, when wholesome remedies would not avail, so he was restrained by a bad passion from quaffing his full measure of evil. *Dickens, Martin Chuzzlewit, xl.*

Also spelled *neutralise*.

-Syn. 3. *Annul, Nullify, Annihilate, Neutralize.* These words agree in meaning the bringing of a thing to nothing, causing it to cease to be absolutely, or as to some special relation. *Annul* represents an official or authoritative act; as, to *annul* an edict. (*See* *abdo*.) *Nullify*, to render invalid or of no avail, is more general and less often official; a law may be *illegally nullified* by inert resistance. To *annihilate* is to reduce to nothing, and should be used only where absolute putting out of existence is meant; such expressions as "his army was *illegally annihilated*" are manifestly improper; "his army was *annihilated*" would be proper by strong hyperbole, if the army was so broken up that no parts of it were ever gathered together again. To *neutralize* is to bring to nothing in respect to some special relation, or to render inoperative or inefficient in respect to certain other agencies or forces, by a contrary or counterbalancing force; as, to *neutralize* an acid, his efforts were *neutralized* by the influence of his opponent. That which is *neutralized* would naturally have force in itself; hence we should not speak of *neutralizing* a law or a command.

neutralizer (nū'tral-iz-er), *n.* [*= neutralize* + *-er*.] One who or that which neutralizes; that which destroys, disguises, or renders inert the peculiar properties of anything. Also spelled *neutraliser*.

It is 6 or 10 in. long, 23 in. extent of wings, of a slim form, with very small bill but widely cleft and capacious mouth, long, sharp, thin-bladed wings, forked tail, and small weak feet; the plumage is intricately blended with black, brown, gray, and tawny shades, something like dark veined marble, and the male has a pure white V-shaped mark on the throat, and large white blotches on the wings and tail, which are tawny in the female. It abounds in temperate North America, and is a bird of powerful flight, often seen careering in pursuit of insects, twisting and doubling with great ease and grace, and frequently falling through the air with a hoarse cry. It lays two eggs of elliptical form and dark variegated

The young are very different, being some shade of dingy brown or chocolate-brown, boldly spotted with white. Night-herons nest in heronries, sometimes of vast extent; they build a bulky frail nest of twigs, and lay 3 or 4 eggs of a pale green color, 2 inches long by 1 1/2 in breadth. The common night-heron of the United States is not specifically distinct from the foregoing; it is popularly called *qua-bird* and *squawk*, from its cry. A small sylviine bird of Europe, Asia, and Africa, belonging to the order *Passeres*, the suborder *Oscines*, the family *Sylviidae*, and the genus *Luscinia*. There are two kinds, formerly regarded as specifically identical, and variously called by ornithologists *Luscinia* or *Sylvia* or *Philomela* or *Lucina* *luscini* or *philomela*, and by other New Latin names. The two kinds are most commonly distinguished as *Luscinia luscinia* or *P. luscinia*, the true nightingale, and *L. philomela*. The former is the one which is common in Great Britain, and to which the name *nightingale* specially pertains. The poets call both birds *philomela* or *Philomela*. The famous song of the nightingale, heard chiefly at night, is the love-song of the male, which commences as soon as his propensities are gratified, as is usual with birds. The nightingale is migratory like nearly all insectivorous birds of the northern hemisphere, extending its migrations far to the north of Europe in the spring. In England, where it appears

about the middle of April and passes the summer, it is quite locally distributed, being very common in some places, and rare in others, and from others apparently equally suited to its habits. It haunts woods, copes, and hedgerows, especially where the soil is rich and moist, and is so

secretive as to be oftener heard than seen. The favorite food of the nightingale is the larvae of insects, especially the hymenoptera, as wasps and ants. The nest is placed on the ground or near it; the eggs are 4 or 5 in number, pale olive brown, about 1 inch long by a little over 1/2 inch broad. The length of the bird is 6 inches; its extent of wings is 10 1/2 inches. The sexes are alike reddish-brown above, below pale grayish brown, whitening on the throat and belly, the tail being brownish red. This nightingale is sometimes specified as the *brake* nightingale, when the other species (*L. philomela*) is called *thrush* nightingale.

This sooted priest, who was gladder than he?

Was never bird gladder again the day,

No nightingale in the month of May,

Nas never moon that late but to singe.

Chaucer, Canon's Yeoman's Tale, l. 382.

Nirvana (nīr-vā'nā), *n.* [*Skt.*, blowing out (as of a light), extinction, *← nīr*, out, + *vaṇa*, blowing, *← vā*, blow, with abstr. noun-suffix *-ana*.] In *Buddhism*, the condition of a Buddha; the state to which the Buddhist saint is to aspire as the highest aim and highest good. Originally, doubtless, this was extinction of existence, Buddha's attempt being to show the way of escape from the miseries inseparably attached to life, and especially to life everlastingly renewed by transmigration, as held in India. But in later times this negation has naturally taken on other forms, and is explained as extinction of desire, passion, unrest, etc.

What then is Nirvana, which means simply going out, extinction: it being quite clear, from what has gone before, that this cannot be the extinction of a soul? It is the extinction of that sinful, grasping condition of mind and heart which would otherwise, according to the great mystery of Karma, be the cause of renewed individual existence. That extinction is to be brought about by, and runs parallel with, the growth of the opposite condition of mind and heart; and it is complete when that opposite condition of mind and heart is reached. Nirvana is therefore the same thing as a sinless, calm state of mind; and, if translated at all, may best, perhaps, be rendered *holiness*—holiness, that is, in the Buddhist sense, perfect peace, goodness, and wisdom. *Rhys Davids*.

Buddhism does not acknowledge the existence of a soul as a thing distinct from the parts and powers of man which are dissolved at death, and the *Nirvana* of Buddhism is simply extinction. *Buddhism*, *Brill.*, IV, 324.

niter, **nitre** (ni'ter), *n.* [C. It is formed in the soil from nitrogenous organic bodies by the action of microbes, and crystallizes upon the surface in several parts of the world, and especially in the East Indies. In some localities where the conditions are favorable it is prepared artificially from a mixture of common mold, or porous calcareous earth containing potash, with animal and vegetable remains containing nitrogen. Under proper conditions of heat and moisture the nitrogen of the decaying organic matter is oxidized to nitric acid, which combines with potash and lime, forming niter and calcium nitrate. This is afterward dissolved in water and purified. At present it is chiefly prepared from sodium nitrate and potassium chloride by double decomposition. It is a colorless salt, with a saline taste, and crystallizes in six-sided prisms. It is used somewhat as an antiseptic and as an oxidizing agent, but its most common use in the arts is in the making of gunpowder. It also enters into the composition of dyes, is extensively employed in metallurgy, and is used in dyeing. In medicine it is prescribed as a diaphoretic and diuretic. The substance called *niter* by the ancients was not potassium nitrate, but either sodium carbonate, more or less mixed with salt and other impurities, or potassium carbonate, chiefly the former, since *niter* is usually spoken of as having been obtained from the beds of salt lakes, where the alkali must have been soda, this being a mode of occurrence peculiar to soda and not to potash. But the *niter* which the ancients speak of as having been obtained by leaching wood ashes was more or less pure potassium carbonate. It was not until the early part of the eighteenth century that soda and potash began to be clearly recognized as distinct substances; and it was considerably later in the century before the chemical relations of the two alkalis were understood. See *sulphate*, *soda*, and *potash*.—**Cubic niter**. Same as *sodium nitrate*. Sweet sp. nit of niter. See *sulphate of nitrous ether*, under *nitrous*.

Same as *nitroglycerin*. **Nitrate of potash**, *niter*. **Nitrate of silver**, silver oxidized and dissolved by nitric acid diluted with two or three times its weight of water, forming a solution which yields transparent tabular crystals on cooling, these crystals constituting the ordinary commercial silver nitrate. See *nitrous*. **Nitric acid**, HNO₃, an acid prepared by distilling a mixture of sulphuric acid and sodium nitrate. When pure it is a colorless liquid, but it is usually yellowish, owing to a small admixture of oxides of nitrogen. It is small, is very strong and disagreeable, and it is intensely acidic. Applied to the skin it cauterizes and destroys it. It is a powerful oxidizing agent, and acts with great energy on most combustible substances, simple or compound, and upon most of the metals. It exists in combination with the bases potash, soda, lime, and magnesia, in both the vegetable and the mineral kingdom. It is employed in etching on steel or copper; as a solvent of tin to form with that metal a mordant for some of the finest dyes; in metallurgy and assaying; also in medicine, in a diluted state, as a tonic, and in affections of the alimentary tract and of the liver; and in concentrated form as a caustic. In the arts it is known by the name of *aqua fortis*. Also called *azotic acid*. **Nitric-acid furnace**, in acid-works, a small furnace where sodium nitrate and sulphuric acid are roasted to supply nitrous fumes for the oxidation of sulphurous acid to sulphuric acid. — **Nitric oxide**, N₂O, or NO, a gaseous compound of nitrogen and oxygen, produced by the action of dilute nitric acid upon copper.

An element existing in nature as a colorless, odorless, tasteless gas, reducible to a liquid under extreme pressure and cold. Its specific gravity is .967. It is neither combustible nor a supporter of combustion, nor does it enter readily into combination with any other element. At a high temperature it unites directly with magnesium, silicon, chromium, and other metals. It forms about 77 per cent of the weight of the atmosphere, and is a necessary constituent of all animal and vegetable tissues. In combination with hydrogen it forms the strong base ammonia, and with hydrogen and oxygen a series of acids of which nitric acid is commercially the most important. It may be most readily prepared from atmospheric air. There are five known compounds of nitrogen and oxygen, viz.: nitrous oxide or nitrogen monoxide, N₂O; nitric oxide, N₂O₂; nitrous trioxide, N₂O₃; nitric trioxide, N₂O₄; nitrogen pentoxide, N₂O₅. It is a light-yellow, oily liquid, of specific gravity 1.6, and is a most powerful explosive agent, detonating when struck, or when heated quickly to 266° F. For use in blasting it is mixed with one-fourth its weight of silicious earth, and is then called *dynamite*. Taken internally, it is a violent poison, but in minute doses is used in medicine in the treatment of angina pectoris and heart-failure. Its clustered pods contain an edible mealy pulp of which the negroes are fond; and in the Sudan the seeds (about fourteen in a pod) after a process of roasting, fermenting in water, etc., are made into a cake which serves as a sauce, though of offensive odor. The name *nitta tree* perhaps covers more than one species. Also called *African locust*.

[In this sense *no* is now confined to provincial use, in the form *no* or *na*, the Scottish form *na* being especially used emphatically, as *nauna, nauna, naunna, naunna*, etc.]

2. Not so; nay; not; with implied, but not expressed, repetition of a preceding (or succeeding) statement denied or question answered in the negative, with change of person if necessary. This is practically equivalent to a complete sentence with its affirmation denied: as, "Was he here yesterday?" "No," that is, "he was not here yesterday." It is therefore the negative categorical particle, equivalent to *no*, and opposed to *yes* or *yea*, the affirmative categorical particle. The fine distinction alleged to have formerly existed between *no* and *nay* according to which no answered questions negatively framed, as, "Will he not come?" *Nay*, while *nay* answered those not including a negative as, "Will he come?" *Nay* is hardly borne out by the records. *Nay* and *no* are ultimately identical in origin, and their differences of use (*nay* being restricted in use and now largely superseded by *no*) are accidental: (a) in answer to a question, whether by another person or asked (in echo or argument) by one self.

Shall it avail that man to say he honours the Martyrs
memory and trades in their steps? *No*; the Pharisees con-
test as much of the holy Prophets. *Milton, Apology for Smectymnus.*

And thus I leave it as a declared truth, that neither the
fears of sects, *no, nor* rebellion, can be a fit plea to stay

more hateful to mine ear. *Shak., Macbeth, v. 7. 9.*

No in old England nothing can be won

Without a Faction (good or ill) be done.

3. Not; used after *or*, at the end of a sentence or clause, as the representative of an independent negative sentence or clause, the first clause being often introduced by *whether* or *if*; as, he is uncertain *whether* to accept it or *no*; he may take it or *no*, as he pleases.

Du-Roi, Nobility.

Sheridan, The Duenna, II. 3.

The great peculiarity of the baronial estate in England as compared with the continent is the absence of the idea of caste: the English lords do not answer to the nobles of France or to the princes and counts of Germany, because in our system the theory of nobility of blood as conveying

political privilege has no legal recognition. English nobility is merely the nobility of the hereditary councillors of the crown, the right to give counsel being involved at one time in the tenure of land, at another in the fact of summons, at another in the terms of a patent; it is the result rather than the cause of peerage. The noblesman is the person who for his life holds the hereditary office denoted or implied by his title. The law gives to his children and kinsmen no privilege which it does not give to the ordinary freeman, unless we regard certain acts of courtesy, which the law has recognized, as implying privilege. Such legal nobility does not of course preclude the existence of real nobility, socially privileged and defined by ancient purity of descent or even by connexion with the legal nobility of the peerage; but the English law does not regard the man of most ancient and purest descent as entitled thereby to any right or privilege which is not shared by every freeman. . . . Nobility of blood—that is, nobility which was shared by the whole kin alike—was a very ancient principle among the Germans, and was clearly recognized by the Anglo-Saxons in the common institution of wergild.

Stubbs, Const. Hist., I. 188.

In England there is no nobility. The so-called noble family is not noble in the continental sense, privilege does not go on from generation to generation, titles and precedence are lost in the second or third generation.

E. A. Freeman, Amer. Lects., p. 303.

(b) In some European countries, as in Russia, a class holding a high rank and enjoying, besides social distinction, special privileges; the noblesse. = Syn. 1. Nobility, Noblesse, elevation, loftiness, dignity. In application to things nobleness is rather more appropriate than nobility, as the nobleness of architecture or one's English, while nobility is more likely to be applied to persons and their belongings, as nobility of character or of rank, but this distinction is not more than a tendency as yet. See *noble*.

It is one of the words selected for the expression of loftiness in spirit and life. With *generous* the idea of liberality in giving has somewhat overshadowed the earlier meaning, that of a noble nature and a free, warm heart going forth toward others as a generous foe disdains to take an unfair advantage. *Magnanimous* comes nearer to the meaning of *noble*, it notes or describes that largeness of mind that has breadth enough and height enough to take in large views, broad sympathies, exalted standards, etc. (See definition of *magnanimity*.) It generally implies superiority of position as a nation so great as the United States or Great Britain can afford to be *magnanimous* in its treatment of injuries or affronts from nations comparatively weak.

2. An old English gold coin, current for the 8d., first minted by Edward III., and afterward by

Richard II., Henry IV., V., and VI., and also by Edward IV., under whom one variety of the noble was called the *ryal* or *rose noble* (see *ryal*). The obverse type of all these nobles was the king in a ship. The reverse inscription, "Jesus autem transiens per medium illorum stat" (Luke iv. 30), was probably a charm against thieves. Badling conjectures, though not with much probability, that the coins derived their name from the noble nature of the metal of which they were composed. The coin was much imitated in the Low Countries. See *George-noble*, *quarter-noble*.

It consists of an inverted pendulum held in a vertical position by a reed or spring connecting it with its support. The force tending to restore the *noddy* to the vertical is the excess of the force of the spring over the moment of gravity, and its oscillation is therefore generally slow.

noddy-poll, *n.* [Also *noddypoll*, *noddipoll*, *noddy-poll*; < *noddy*¹ + *poll*.] A simpleton.

In *astron.*, one of the points in which two great circles of the celestial sphere, such as the ecliptic and equator, or the orbit of a planet and the ecliptic, intersect each other; especially, one of the points at which a celestial orbit cuts the plane of the ecliptic. In *geom.*: (a) A point upon a curve such that any line passing through it cuts the curve at fewer distinct points than lines in general do. At a node a curve has two or more distinct tangents. If two of these are real, the curve appears to cross itself at this point; if they are all imaginary, the point is isolated from the rest of the real part of the curve. (b) A double point of a surface; a point where there is more than one tangent plane; especially, a conical point where the form of the surface in the infinitesimally distant neighborhood is that of a double cone of any order. (d) In *geom.*, a rounded, variously shaped mineral mass: a form of concretionary structure frequently seen, especially in clay and argillaceous limestones. The earthy carbonate of iron (siderite), an important ore, very commonly occurs in the nodular form. The common clay-stones called *nodules* in Scotland furnish a good illustration of this mode of occurrence of mineral matter. The nucleus of all these is generally some organized substance, as a piece of sponge, a shell, a leaf, a fish, or the excrement of fishes or other animals; but sometimes an inorganic fragment serves as the center. nominalism (nom'i-nál-izm), *n.* [= F. *nominalisme*, as *nominal + -ism*.] The doctrine that nothing is general but names; more specifically, the doctrine that common nouns, as *man*, *horse*, represent in their generality nothing in the real things, but are mere conveniences for speaking of many things at once, or at most necessities of human thought; individualism. Medieval thinkers, especially those of the twelfth century, are classified as being either nominalists or realists; modern philosophers have generally joined in the condemnation of medieval realism, but have nevertheless been mostly rather realists than nominalists. The following are the most important varieties of nominalism: (a) That of the school, who held that the only sort of thing that is not universal, and indeed the only sort that is not corporeal, is the meaning of a word (Gr. *νόμος*, *νόμος*, *νόμος*, something different from the actual thing and distinct for each language). (b) That of Roscelin, condemned by the Church in 1092 which, though regarded as a novel doctrine by his contemporaries, as that he has often been called the founder of nominalism, had in substance been taught for two hundred years without attracting any particular attention. His views, so far as we can gather them from the reports of malicious adversaries, in the light of other nominalist texts, were as follows. Various relations, usually considered as real, such as the relation of a wall to a house as a part of it, have no existence in the things themselves, but are due to the way we think about the things. Colors are nothing over and above the colored bodies. He held that nothing exists but individuals, and according to St. Anselm was "buried in corporeal images." His opinion concerning universals was not called *nominalism*, but the *verbalis* *verum*, or *verbalis*. Anselm states that he held universals to be nothing but the breath of the voice (*sermo verus*). This statement should not be hastily put aside as an enemy's misrepresentation, for the authorities agree that he made universals to be not words, but vocal sounds, and since the breath was in his time and long after hardly regarded as a material thing, he may quite probably have been so "buried in corporeal images" as to have confounded the breath of the voice with an incorporeal form, which agrees with a report that he was a follower of the pantheist

2. Possessing a *nomen juris* or legal name or designation; characterized or distinguished by a particular name. **Nominate right**, in *Socis lex*, a right that is known and recognized in law, or possesses a *nomen juris*, which serves to determine its legal character and consequences. Of this sort are those contracts termed *donum, commodatum, depositum, pignus, ante*, etc. **Nominate rights**

With regard to the ethical religions the question has been mooted and a rather puzzling question it is -- What right have we to divide them into *nomistic* or *nomothetic* communities, founded on a law or Holy Scripture, and *universal* or *world religions*, which start from principles and maxims, the latter being only three -- Buddhism, Christianity, and Mohammedanism?

C.), one of a panel of heliasts or jurors intrusted with the decision as to any proposed change in legislation. It was provided that all motions to repeal or amend an existing law should be brought before the *nomotheta* or general meeting of citizens, at the beginning of the year. They might be then and there rejected, but if a motion was rejected favorably, the *nomotheta* appointed a body of *nomothetai*, sometimes as many as a thousand in number, before whom the proposal was put on trial according to the regular forms of Athenian judicial procedure. A majority vote of the *nomothetai* was decisive for acceptance or rejection. See quotation under *nomotheta*.

Part of the nonjuring bishops retained the use of the Prayer-book of 1662, others restored the communion office of 1549, and afterwards (in 1718) introduced one founded on this, but largely conformed to primitive and Oriental rites. This created a strong influence, the various forms of the Scottish communion office till that of 1764, from which the prayer of consecration in the American Prayer-book is derived. According to their acceptance or rejection of certain ceremonies called the *nonces*, the nonjurors were divided into two parties, called *nonces* and *non-nonces*. In the year 1717 the nonjurors made an attempt to establish in communion with the Orthodox Eastern Church, but without success. The nonjurors are noted for the gross lewdness and perversity of some of their leaders, such as Ken (collier), Latt, Nelson, Lee, etc. Among the Presbyterians of Scotland there was also a party known as *nonjurors* or *nonjurants*, who refused the oath of abjuration (afterward altered) as involving recognition of episcopacy.

In the vicinity of Nice it is the object of a special fishery, particularly during the month of March, the small fishes being considered a very dainty dish. An inhabitant of Normandy, a duchy and later a province of northern France bordering on the English Channel; a member of that branch of the Northmen or Scandinavians who in the beginning of the tenth century settled in northern France and founded the duchy of Normandy. They adopted to a large extent the customs and language of the French. In the eleventh century their duke conquered England (see *Norman Conquest*), and about the same time Norman adventurers established themselves in southern Italy and Sicily. Since the reign of John (1199-1216) the duchy of Normandy has been, except for a short period, a part of France.

The *Norman*, with the softened form of his name, is distinguished from the *Northman* by his adoption of the French language and the Christian religion. *E. A. Freeman, in Encyc. Brit.*, XVII, 500.

2. Same as *Norman French* (which see, below).

II. *a.* Of or pertaining to Normandy or the Normans.—**Norman architecture**, a round arched style of medieval architecture, a variety of the Romanesque, introduced before the Norman Conquest from Normandy into Great Britain, where it prevailed after the Conquest until the end of the twelfth century. The general character of this style is a massive and rugged simplicity, not destitute of studied proportion, and often

with the grandeur attendant upon great size and solidity. The more specific characteristics are: churches cruciform with apse and apsidal chapels, and a great tower rising from the intersection of nave and transept; vaults plain and semi-cylindrical; doorways, the glory of the style, deeply recessed, often with rich moldings covered with surface sculpture, sometimes continuous around both jamb and arch, but more usually springing from a series of shafts, with plain or enriched capitals; windows small, round-headed, placed high in the wall, and opening inward with a wide splay; piers massive, cylindrical, octagonal, square, or with engaged shafts; capitals cushion, bell, or lily-shaped, sometimes plain, more frequently sculptured in fanciful forms or in a reminiscence of the Corinthian or Ionic; buttresses broad, with but small projection; walls frequently decorated with bands of arcades of which the arches are single or interlaced. Toward the close of the twelfth century the style became much modified. The arches began to assume the pointed form, the vaults to be groin-vaulted or formed by the intersection of two subsidiary vaults at right angles; the piers, walls, etc., to become less heavy; the towers to be developed into spires; and the style, having assumed in every particular a more delicate and refined character, passed gradually into a new style, the early pointed. Besides ecclesiastical buildings, the Normans reared many noble and powerful fortresses and castellated structures, the best remaining specimen of which in England is the White Tower of Keep of the Tower of London.—**Norman Conquest**, or simply *the Conquest*, in *Eng. hist.* the conquest of England by William, Duke of Normandy (William the Conqueror). It was begun by and is usually dated from his victory at Bosham (Hastings), in 1066. The leading results were the

downtail of the native English dynasty, the union of England, Normandy, etc., for a time under one sovereignty, and the introduction into England of Norman-French customs, language, etc.—**Norman embroidery**, a kind of embroidery consisting of crewel-work which is picked out or heightened by other embroidery stitches. *Dict. of Needlework.* **Norman French**, a form of French spoken by the Normans, which became upon the Conquest the official language of the court and of legal procedure, undergoing in England a further development (Anglo-French), until its final absorption in English. (See *English*, 2.) **Norman French** was the language of legal procedure until the reign of Edward III. Pol. nos = Russ. nosa = Lith. nosis = OPruss. nazy = Skt. nasa, nasa, nasa, nose; root unknown.*] The Gr. word is different: *rhîs* (rhîs-), nose. (Cf. *nose, na. c.* Hence *nagle, nozzle, nuzzle*.) 1. The special organ of the sense of smell, formed by modifications of certain bones and fleshy parts of the face, its cavities, or fossæ, freely communicable with the cavities of the mouth and lungs, and hence also concerned in respiration, the utterance of words or vocal sounds, and taste. It is lined throughout by a highly vascular mucous membrane called the *parietal* or *Schneiderian*, continuous with the skin through the nostrils, the conjunctiva of the eye, and the mucous membrane of the pharynx and sinuses. It is in this membrane that the fine filaments of the olfactory nerves terminate, and over it the inspired air containing odorous substances passes. The olfactory region, or that region to which the olfactory nerves are distributed, however, includes only the upper and middle turbinate parts of the nasal bones and the upper part of the septum; the lower part of the cavity has nothing to do with olfaction. Externally the nose commonly forms a prominent feature of the face or facial region of the head, when very long it becomes a *proboscis*, and may acquire a tactile or manual function, as in the elephant, hog, mole, etc. The nose of an animal when moderately prominent is usually called a *snout, muzzle, or snuff*. The *bridge* of the nose is a notch of its external prominence as it is bridged over by a bone in the nasal bones. The external opening of the nose is the *nostril*, usually paired, right and left, and technically called *nares*. The inner passages or cavities of the nose are the *nasal fossæ* or *sinus*, they open in series into the upper part of the pharynx, by orifices called the *posterior nares* or *choanae*, above the soft palate. The animal whose nose most resembles man's in size and shape is the proboscis-monkey, *Nasalis larvatus*, whose nose is

more prominent than that of most men. Prominence of the nose is to some extent an indication of ascent in the scale of human development, the nose being flattest in the lowest or negroed races. A large nose is commonly supposed to indicate strength of character, and thin clean-cut nostrils are generally a sign of high nervous organization. Besides its special function of smelling, the nose has in all animals a respiratory office, being, rather than the mouth, the usual passageway for air in both inspiration and expiration; it also serves to modify or modulate the voice, and to discharge the secretion from several cavities of the head, as the frontal and other sinuses, and the tears from the eyes. See *cuts under mouth, nasal, Nasalis, and Comptulura*.

In the earlier history of writing, a person whose vocation it was to make notes or memoranda of acts of others who wished to preserve evidence of them, and to reduce to writing deeds and contracts. —2. A public officer authorized by law to perform similar functions, and to authenticate the execution of deeds and contracts, and the accuracy of copies of documents, and to take affidavits and administer oaths. Such an officer, although now commonly spoken of as a *notary*, is more formally designated

as a *notary public*, or *public notary*. In England these officers are appointed by the Court of Faculties of the Archbishop of Canterbury, the office having arisen under the civil and ecclesiastical law. In France they are appointed by the government, although the power of appointment was formerly claimed by the Pope. In the United States they are appointed in the several States usually by the governor, the power of appointment being defined by the law of the State. The general powers of notaries are not defined by statute, being derived from the civil law and the law merchant; and their official acts, attested by signature and official seal, are generally received in evidence in whatever country they are offered, while similar acts of commissioners and other purely statutory officers are generally receivable only in the jurisdiction for which the officer was appointed, unless specially authenticated by some judicial authority. In various jurisdictions some special powers have been conferred upon notaries besides those derived from the origin and nature of their office. — **Apotolical notary**, an official charged with despatching the orders of the papal see. — **Ecclesiastical notary**, in the early church, a clerk or secretary, especially a shorthand-writer, employed to record the proceedings of councils and tribunals, report sermons, take notes, and prepare papers for bishops and abbots. — **Notary public**. notate (nô'tat), *a.* [*< L. notatus, pp. of notare, mark; see note¹, v.*] In *zool.* and *bot.*, marked with spots or lines; variegated.

notation (nô'ta'shon), *n.* [= *F. notation* = *Sp. notacion* = *Pg. notação* = *It. notazione*, *< L. notatio(n-)*, a marking, a designation, an observation, the designation of the meaning and derivation of a word, etymology, *< notare, mark, designate; see note¹, v.*] 1. The act of noting, in any sense. —2. A system of written signs of things and relations (not of significant sounds or letters), used in place of language on account of its superior clearness and brevity. Notations are employed to advantage in every branch of mathematics, in logic, in astronomy, in chemistry, in music, in proof-reading, etc. (a) Two systems of arithmetical notation are now in use, the Roman and the Arabic. The Roman system is employed for numbering books and their parts. In monumental inscriptions, and in marking timber and other objects with the chisel. A large number in this system is written as follows: As many thousands as possible being taken from the number (without a negative remainder), an M is written for every thousand five hundred is then taken, if possible, and D is written for it; as many hundreds as possible are next taken, and a C written for each; fifty is next taken, if possible, and L is written for it; as many tens as possible are next taken, and an X written for each; five is then taken, if possible, and V is written for it; and finally an I is written for every unit remaining. But usually instead of IIII is written IV, in place of VIIII, IX, in place of XXXX, XL, in place of LXXXX, XC, etc. Anciently, there were other extensions of this system. The Arabic notation consists in the use of the Arabic figures and decimal places. See *Arabic* and *decimal*. (b) In the algebraic notation employed in all branches of mathematical analysis all objects upon which the operations of addition, multiplication, etc., are performed are denoted by letters. These objects are generally quantities (and are so called in describing the notation), though they may be operations, as in the calculus of functions, etc., geometrical conditions, as in enumerative geometry, or propositions, as in the calculus of logic. It is usual to give certain letters certain significations (for which see the letters). Furthermore, ∞ denotes infinite magnitude, $\frac{a}{b}$ the ratio of the circumference to the diameter, or $\frac{1}{\pi}$, the Napierian base, or 2.71828...; \angle , a right angle, etc. The sign \approx placed between two quantities states their equality, as, sp or mercury = 13.5. In like manner, $>$ means "greater than," $<$ "less than," " \leq " is as small as," " \geq " is as great as," " \neq " is smaller than or equal to," " \equiv " is greater than or equal to," " \neq " is not equal to," " \leq " is not smaller than," " \geq " is not greater than," " \propto " is proportional to, " \cong " is congruent to, in the theory of numbers. The last sign is also used to mean "is identically equal to," thus stating two relations, one mathematical, the other logical. The sum of two quantities is denoted by writing them with the sign $+$, called *plus*, between them; as, $3 + 2 = 5$. The difference of two quantities is denoted by writing first the minuend, then the sign $-$, called *minus*, then the subtrahend; as, $5 - 3 = 2$. When $+$ or $-$ occurs with no quantity before it, it is to be supplied; thus, $5 - 5 = 0$ means that 5 is less than 5 is 2 below zero. But when a value has $+$ or $-$ before it and no quantity following, what is meant is that

something further is to be added or subtracted. The sign \pm , called *plus* or *minus*, is ordinarily used in a disjunctive sense in writing the root of a quadratic equation. Thus, if $x^2 + x = 1$, we write $x = -\frac{1}{2} \pm \sqrt{\frac{5}{4}}$, meaning that the equation is satisfied only by the two values $x = -\frac{1}{2} + \sqrt{\frac{5}{4}}$ and $x = -\frac{1}{2} - \sqrt{\frac{5}{4}}$. The sign \pm is also used in astronomy, geodesy, etc., after a value determined by observation, to introduce the probable error of that determination. Summation is also signified by the letter Σ .

Thus, $\Sigma \frac{1}{i}$ means that in the expression $1 + \frac{1}{i}$ all the whole numbers from 1 to n inclusive are to be successively substituted for i and the resulting values added together to give the quantity denoted by the expression. When the limits are not indicated, the lower one is to be understood as constant, and generally zero, and the upper one as one less than the actual value of the variable. For example, if we write $\Sigma (2x + 1) = x^2$, this signifies

$$\sum_{i=1}^n (2i + 1) = x^2.$$

In like manner, Δ is used to signify the difference, or the amount by which the quantity written after it would be increased by increasing the variable by unity. The variable may be indicated by a subjunctive letter; thus, $\Delta x = (x + 1) - x = 1$, but $\Delta x^2 = (x + 1)^2 - x^2 = (x^2 + 2x + 1) - x^2 = 2x + 1$. The product of two quantities is denoted by writing them in their order, either directly, or with an interposed cross (\times) or dot (\cdot); thus, $3 \times 5 = 15$, $3 \cdot 5 = 15$. A quotient is usually denoted by one of the signs $-$ or $/$, with the dividend before it and the divisor after it, or by a horizontal line with the dividend above and the divisor below. A continued product is also written with Π , just as a summation is written with Σ ; but when the limits are not indicated, the lower one is constant, and generally unity, and the upper one the actual value of the variable. A positive whole number with the mark of admiration (!) after it denotes the continued product of all numbers from 1 up to that number inclusive; thus, $4! = 24$. Instead of the mark of admiration, a right-angled line beneath and at the left of the number is sometimes used; as, $4_!$. A power of a quantity is denoted by writing the exponent to the right and above the base; thus, $x^3 = x \cdot x \cdot x$. This notation is extended to symbols of operation. Thus, $\Delta u = \Delta x u$ and $\Delta^2 u = \Delta(\Delta u)$. If the exponent is included in parentheses, the quantity denoted is the continued product of a number of factors equal to the exponent, one factor being the base, and the others the results of successive subtractions of 1 from the base; thus, $x^{(3)} = x(x-1)(x-2)$. A root is denoted either by a fractional exponent, or by the sign $\sqrt[n]{}$ written before the base, with the index above and to the left; thus, $\sqrt[3]{8} = 2$. If the index is omitted, it is understood to be 2. One of the most important parts of algebraical notation is the use of parentheses, $()$, square brackets, $[\]$, braces, $\{ \}$, and vincula or horizontal lines above the expressions, to signify that the symbols so included are to be treated as signifying one quantity. Thus, $(3 + 2) \times 5 = 25$, but $3 \times (2 \times 5) = 30$. Functions are usually denoted by operative symbols, especially f , F , ϕ , ψ , written before the variable, the latter being often included in parentheses. If there are several variables, these are included in one parenthesis and separated by commas, as $F(x, y)$. Various special functions have special abbreviations, as \log for logarithm, \sin for sine, \cos for cosine, \tan for tangent, \cot for cotangent, \sec for secant, \csc for cosecant, \sin for versed sine, \sinh for hyperbolic sine, \cosh for hyperbolic cosine, and so on. (For the special notation of matrices, determinants, groups, and groups, see those words.) A differential is expressed by d before the function, and a partial differential is now generally written with ∂ instead of d ; the variable is indicated, if necessary, by a subjunctive letter. A variation is expressed by a δ before the varying quantity. A differential coefficient is most frequently expressed fractionally as a ratio of differentials, or by $\frac{d}{dx}$, etc., written before the function. But the capital D is often used; thus, $Dx^2 = 2x$, and $D \log x = \frac{1}{x}$. Differentiation relatively to the time is frequently expressed by accents; thus, $\dot{x} = \frac{dx}{dt}$ and $\ddot{x} = \frac{d^2x}{dt^2}$. Dots over the letters are also used instead of the accents, this being the original functional notation of Newton. The differential coefficients of a function are frequently denoted by accents attached to the operational symbols; thus, $f'x = Df(x)$. A number of other differential operations are indicated by special operational symbols, as ∇ for Laplace's operator. The integral of an expression is written with the sign \int , introduced by Leibniz, before the differential. The limits of a definite integral are written above and below this sign. Besides these notations, there are many others peculiar to different branches of mathematics.

3. Etymological signification; etymology.

The notation of a word is in the original thereof is sought out, and constituted in two things: the kind and the figure.

Conscience is a Latin word, and according to the very notation of it, imports a double or joint knowledge. South.

4. In music, the act, process, or result of indicating musical facts by written or printed characters. As a process and a series, musical notation is a branch of acoustics or semi-acoustics in general. Notation is also used as a collective term for all the signs or musical facts taken together. Notation, whether regarded as a science or as a body of visible characters, may be divided into notation of pitch, of duration, of force of style, etc. The various historic systems of notation are noted particularly about pitch than the other matters. (a) The absolute and relative pitch of tones has been represented by letters, by numbers, by syllables, by numerals by a staff, and by more than one of these methods at once. The ancient Greeks and Romans used their alphabets, assigning sometimes a separate letter or similar character to each tone of their tonal systems and sometimes using only seven letters, which were repeated for successive octaves. The medieval notation, which included all the different methods, used both separately and in conjunction, letters, names being derived from the ancient notations, were appearing

early from an unknown source, and solmization and the staff system being invented and developed from about the eighth or ninth century. Modern notations include all varieties except neumes. See letter names, neume, solmization, numerical, keyboard, scale, staff, etc. (b) The absolute and relative duration of tones has been much less fully indicated than pitch. The ancient and medieval systems were decidedly defective in this regard. The appearance about the twelfth century of measurable music necessitated the use of characters having a definite metrical value, hence came the note-system, which was combined with the staff, and also the various systems of tablature. In modern music two methods are used: notes whose shape indicates relative time-value, and a kind of tablature peculiar to the tonic sol-fa system. (See note, tabulation, tonic sol-fa (under tonic), etc.) Furthermore, the general tempo of a piece or passage is indicated by such Italian terms as *grave*, *adagio*, *crescendo*, *moderato*, *allegro*, *ritardando*, *presto*, etc. Alterations of tempo during a piece are indicated by *accelerando*, *piu mosso*, *trappando*, *ritardando*, *rit. ant.*, *rit. cresc.*, etc. The metrical treatment of individual tones is marked by *staccato*, *legato*, etc. (c) The absolute and relative force or accent of tones is still less fully indicated than pitch or duration. Vertical lines called bars have been used since medieval times to indicate rhythmic and metrical sections or measures, each of which begins with a primary accent. In modern music various words and arbitrary signs are used, as *forte*, *piano*, *crescendo*, *diminuendo*, *marcato*, etc. (d) Other signs of various practical import are the *brace*, *repeat*, *da capo*, *double bar*, *diver*, etc. See those words. (e) The general style of a piece or passage is often indicated in modern music by such terms as *ad libitum*, *capitolo*, *arpeggio*, *cantabile*, *crescendo*, *moderato*, *can. br.* (f) Specific directions about performance by the voice or an instrument also occur, as *mezzo voce*, *arato*, *portamento*, *divisi*, *meno mosso*, *pizzicato*, *sea (cello)*, *pedal*, and many others. All these verbal marks are translated into different languages, and are subject to modification for particular effects. (g) Modern music, following the later medieval music, also employs to some extent a kind of numerical shorthand for harmonic facts. See thorough bass, and figured bass (under bass).

In *printing*: (a) An explanatory statement, or reference to authority quoted, appended to textual matter and set in smaller type than the text. Notes are of several kinds. A *cut in note* is set in a space left in the text, near the outer margin, and as nearly as possible in line with the matter referred to. A *center note* is placed between two columns, as in cross-references in some editions of the Bible. A *side note* or *marginal note* is placed in the outer margin of the page, parallel with the lines of the text. A *foot note*, or *bottom note*, follows the text at the foot of the page, but does not encroach on the margin, as *side notes* do. A *shoulder-note* is one at the upper inner corner of a page. In some countries, as China and Japan, all notes are placed at the top of the page. A *note* is, in a strict sense, an official communication in writing from the Department of Foreign Affairs of one of the states to a foreign diplomatic representative, or vice versa. 12. A small size of paper used for writing letters or notes.—13. In *music*: (a) In the staff-notation, a character or sign by which a tone is recorded and represented to the eye. A note consists of from one to three parts: the head, the stem or tail, and one or more penman's flags, or hooks, as *♩*, *♪*, *♫*, which are often extended from one note to another in the form of bars, when two or more notes of the same denomination are grouped together. The pitch of the tone is indicated by the position of the note on the staff relative to the clef and the key-signature. (See *staff*, *clef*, *signature*, *key*.) The relative duration of the tone is indicated by the shape of the note. The system of notes now in use includes the following: the *breve*, *♭*; the *semi-breve* or *whole note*, *♩*; the *minim* or *half-note*, *♪*; the *crotchet* or *quarter note*, *♫*; the *quaver* or *eighth note*, *♬*; the *semiquaver* or *sixteenth-note*, *♭*; the *demisemiquaver* or *thirty-second-note*, *♮*; and the *hexadesimsemiquaver* or *sixty-fourth note*, *♭*.

Each of these notes may be placed upon any staff-degree, and thus may signify a tone of any pitch whatever. Each of them, also, may have any time value whatever, but when in a particular piece or passage a definite time value is assumed for any one of them, a breve is then regarded equal in that piece or passage to two semibreves, a semibreve to two minims, a minim to two crotchets, etc. In other words, as a metrical notation, this system of notes is relative to an assumed value for one species, but absolute and definite after such an assumption. The pitch value of a note may be modified by an *accidental* (which see), though the latter may also be regarded as changing the staff rather than the note. The time value of a note may be modified by various marks, such as a dot after it (as *♩* or *♫*), which lengthens the note by one-half its original value, the *tie* (*♭* or *♮*), which binds two notes on the same pitch together and adds their respective values together; the *pause*, *hold*, or *fermata* (*♭* or *♮*), which lengthens the value of the note indefinitely according to the will of the performer; the *staccato* (*♭* or *♮*), which shortens the actual duration of the note and supplies the deficiency by a silence or rest. (See the various words.) This system is derived from the medieval system, though with important changes. The Gregorian system of notes, which is still in use, is much nearer to the medieval system. It includes the following notes: the *lance*, *♭*; the *long*, *♮*; the *breve*, *♭*; and the *semibreve*, *♮*. These in turn were derived from the early neumes. They were first used merely as indications of pitch, their time-value being indefinite, and dependent wholly upon the text sung to them, but they acquired a definite metrical significance under mensural music. In modern usage they are generally treated as metrical. A special development of the ordinary system of notes is that of *character-notes*, which are varied in shape so as to indicate not only various time values but also the scale value and characteristic qualities of the tones indicated. Thus the tone or *do* is always represented by one shape, the dominant *sol* by another, the subdominant *fa* by a third, etc. The system thus aims to secure at once the utility of the staff and of a reference to the abstract scale. (b) A musical sound or tone, in general or particular; as, the *note* of a bird; the first *note* of a song, etc. (This use of the word, as applied to musical tones, is very common, but is confusing and inaccurate.)

A general concept; a mental representation of a state of things. Thus, the general enunciation of a geometrical theorem is comprehended by means of notions, and only in that way can the property to be proved be firmly seized by the mind, and kept distinct from . . . properties of the same figure; but one . . . to prove the theorem a construction or diagram is requisite, involving a representation in the imagination capable of being studied so as to observe hitherto unknown relations in it.

A completion of notions is nothing else but an affirmation or negation in the understanding or speech.

Burgesius, tr. by a Gentleman, I. II. 1

Concept or notion are terms employed as convertible, but while they denote the same thing, they denote it in a different point of view. . . . Conception, the act of which concept is the result, expresses the act of comprehending or grasping up into unity the various qualities by which an object is characterized; notion, again, signifies either the act of apprehending, signifying, that is, the remarking or taking note of the various notes, marks, or characters of an object which its qualities afford, or the result of that act. . . . The term notion, like conception, expresses both act and its product.

3. In the Lockian philos., a complex idea.

The mind often exercises an active power in making these several combinations; for, it being once furnished with simple ideas, it can put them together in several compositions, and so make variety of complex ideas, without examining whether they exist so in nature. And hence I think it is that these ideas are called notions, as if they had their original and constant existence more in the thoughts of men than in the reality of things.

Locke, Human Understanding, II. xxi. § 2.

4. [Trans. of G. Hegel.] In the Hegelian philos., that comprehensive conception in which conflicting elements are recognized as mere factors of the whole truth.—5. notochord (nō'tō-kōrd), n. [*Gr. νότος*, the back, + *χρῶν*, a string.] The chorda dorsalis or primitive backbone: a fibrocellular or cartilaginous rod-like structure which is developed in vertebrates as the basis of the future spinal column, and about which the bodies of the future vertebrae are formed. It is one of the earliest embryonic structures, and persists throughout life in many of the lower vertebrates, which are on this account called *notochordal*; but in most cases it is soon absorbed and replaced by a definite cartilaginous or bony spinal column. The soft pulpy substance which may be seen filling in the cupped ends of the vertebrae of a fish, as brought to the table, is a part of the remains of the notochord. Anteriorly, in skullless vertebrates, the notochord runs into the base of the skull as far as the pituitary fossa. (See *paranotochord*.) The caudal division of a notochord is often called *urochord*. Such a structure is characteristic of tunicates or ascidians, called on this account *Urochorda*, and approximated to or included among vertebrates. (See *Appendicularia*.) A sort of notochord occurring in the acorn-worms has caused them to be named *Hemichorda*. (See *Halarglossus* and *Heteropneusta*.) The posterior antennae are modified for attachment, and the creature lives in the branchial cavity of ascidians.

II. *n.* In church hist., one of a sect founded in the middle of the third century by Novatianus (also called Novatus), a presbyter of Rome, who had himself consecrated bishop of Rome in opposition to Cornelius in 251. Another Novatus (of Carthage) was joint founder of the sect. Novatianus denied that the church had power to absolve or restore to communion those who after Christian baptism had lapsed or fallen into idolatry in time of persecution, and his followers appear to have refused the grant of forgiveness to all grave post-baptismal sin and denied the validity of (atholic baptism, considering themselves the true church. They assumed the name of *Cathari*, 'the Pure' on the strength of their severity of discipline. In other respects than these mentioned the Novatians differed very little from the Catholics, and they were generally received back into communion on comparatively favorable terms. 3. In law, the substitution of a new obligation for an old one, usually by the substitution of a new debtor or of a new creditor. The term, however, is sometimes used of the substitution of a new obligation between the original parties, as the substitution of a bill of exchange for a right of action arising out of a contract of sale, though this is more commonly called *novation* or *novation*. While in an assignment the old claim merely passes into other hands, in a novation there is a new claim substituted for it. The term is derived from the Roman law, where it was of great importance, because assignment of claims did not exist. It is possible by one novation to extinguish several obligations; as, if A owes a debt to B, B to C, and C to D, and it is agreed that A shall pay D in satisfaction of all, this promise, if consented to by all parties, extinguishes all the other claims, even though not performed.

Those of Justinian (A. D. 527-66) are the best-known, and are commonly understood when the term is used. The *Novels*, together with the *Institute*, *Code*, and *Digest*, form the body of law which passes under the name of Justinian. Also *novella*.

By the civil law, no one was to be ordained a presbyter till he was thirty-five years of age, though by a later novel it was sufficient if he was above thirty.

The famous decision which Glanville quotes about legitimation is embodied in what then was an Extravagant of Alexander III., delivered to the bishop of Exeter in 1172, founded no doubt on a Novel of Justinian, but not till now distinctly made a part of church law.

Stubbs, *Medieval and Modern Hist.*, p. 306.

4. A fictitious prose narrative or tale, involving some plot of more or less intricacy, and aiming to present a picture of real life in the historical period and society to which the persons, manners, and modes of speech, as well as the scenery and surroundings, are supposed to belong. Its method is dramatic, and the novel may be regarded as a narrative play to the extent that the various persons or characters, upon whose qualities and actions the development and consummation of the plot or motive depend, are brought upon the scene to play their several parts according to their different personalities, disclosing, with the aid of the author's delineation and analysis, diverse aspects of passion and purpose, and contributing their various parts to the machinery of the drama to be enacted among them. The novel may be regarded as representing the third stage of transition in the evolution of fictitious narrative, of which the epic was the first and the romance the second. The novel in its most recent form may be divided, according to its dominant theme or motive, into the philosophical, the political, the historical, the descriptive, the social, and the sentimental novel; to which may be added, as special forms, the novel of adventure, the novel of society, the novel of character, the novel of criticism and satire, the novel of reform, and the military, the nautical, and the sporting novel.

Dime novel. See *dime*.—*Novels* (or *Novellae*) of Justinian. See *def. 3*.—*Syn. 4*. *Tale*, *Romance Novel*. *Tale* was at one time a favorite word for what would now be called a novel, as the *tales* of Miss Austen, and it is still used for a fiction whose chief interest lies in its events as Maryat's sea tales. "Works of fiction may be divided into romances and novels. . . . The romance chooses the characters from remote, unfamiliar quarters, gives them a fanciful elevation in power and prowess, surrounds them by novel circumstances, verges on the supernatural, does possess its life, and makes much of fictitious sentiments, such as those which characterized chivalry. The poor sensation novel has points of close union with the earlier romance. . . . The novel, so far as it adheres to truth, and treats of life broadly, descending to the lowest in grade, deeply and with spiritual forecast, seeing to the bottom, is not only not open to those objections, but rather calls for commendation." the network (Klein). The nucleolus of the human ovum was discovered by Wagner in 1836, and hence is sometimes called the *spot of Wagner* in anatomical text-books. See *cut under cell*, 5.

A large, clear, spherical nucleus is seen in the interior of the nerve-cell; and in the centre of this is a well-defined small round particle, the nucleolus.

Huxley, Crayfish, p. 187.

24. Specifically, in *Infusoria*, a minute particle attached to the exterior of the nucleus (or "ovary"), supposed to function as a testicle. But since it is the essential characteristic of a nucleolus to be contained within a nucleus, these so-called nucleoli of protozoans are now differently interpreted, and called *paranucleoli*. See *paranucleolus*.

3. In *bot.*, a small solid rounded granule or particle in the interior of the nucleus. There may be several nucleoli in each nucleus.

Then, such stories get to be true in a certain sense, and indeed in that sense may be called true throughout; for the very nucleus, the fiction in them, seems to have come out of the heart of man in a way that cannot be imitated of malice.

The regimental fashions by his (Cromwell's) master hand, steady, perfectly ordered, and enthusiastic in their cause, became the nucleus of the far-famed Ironsides.

Edinburgh Rev., CLXV, 403.

(a) In *bot.*, the kernel of a cell, in general, a central or interior differentiated mass of protoplasm, found in nearly all cells, vegetable or animal, and consisting of an oval or rounded body composed of (1) a nuclear membrane, (2) nuclear network, and (3) nucleoplasm, and containing nucleoli. The nuclear network is made up of threads or fibrils which are composed of a deeply staining part, "chromatin," and a feebly staining intermediate substance, "linin" or "parachromatin" (nucleohyaloplasm). In the meshes of the network is found the more fluid part of the nucleus, the nucleoplasm (achromatin, *hazy hyaline*, paralinin). Nucleoplasm, according to Carney, consists of a plastin network and a granular fluid, "enchelyma." The nuclear membrane is considered by some observers to be an inner limiting layer of cell-protoplasm surrounding the nucleus, by others to be a condensation of the peripheral portion of the nuclear network. There may be but one nucleus or several nuclei in one cell, and a nucleus may be nucleolate or not. Nuclei are generally proportionate in size to the cell containing them. In some instances, however, they form almost the entire cell mass. A structural difference between the nucleus and the rest of the cell-protoplasm is indicated by its greater resistance to powerful reagents, and by its varied reaction with stains. Functionally, the nucleus is the most important portion of the cell, as it is here that the complex series of changes known as karyokinesis take place, resulting in the division of the nucleus and followed by the division of the cell. This process of mitotic or indirect cell-division is found in all varieties of cells, whether vegetable or animal, fetal or adult, normal or pathological. Instances of cell-division not mitotic have, however, been noted. The nucleus of the human ovum was discovered by Purkinje in 1825, and hence is often called the *spot of Purkinje*. Its usual name in text-books of anatomy is *germinal vesicle*. See *cut under cell*, 5. (b) In *zool.* (1) In *amphibia*, the alimentary and reproductive vial, collectively, when these are aggregated into a mass, as in the *salpa*. (2) In *protozoans*, a solid rod like or trap shaped body, having in many cases the functions of an ovary in connection with a nucleolus (see *nucleolus*, 2). (3) In *echinoderms* the madreporiform body. (c) In *anat.* a collection of ganglion-cells in the brain or other portion of the cerebrospinal axis. (d) In *conch.*, the embryonic shell which remains at the apex of the mature shell, as of a gastropod; also, the initial point from which the operculum of a gastropod grows. See *præconch*. (e) A body having a stronger or weaker attraction for the gas, vapor or salt of a solution than for the liquid part of it and therefore modifying by its presence the freezing- and boiling-points. *Biemer*. (f) In *astron.*, the bright central point usually present in the head of a comet and often in a nebula.

(*noon* + *shun*; the association with *noon* being either a coincidental, or else due to the origination of *nunchoon*, as Skeat claims, in the rare ME *noneschenche* for *noneschenche*, a donation for drink, lit. 2. In *pathol.*, a constant nodding or involuntary shaking of the head. *Dunglison*.—3. In *astron.*, a small subordinate gyratory movement of the earth's axis, in virtue of which, if it subsisted alone, the pole would describe among the stars, in a period of about nineteen years, a minute ellipse, having its longer axis directed toward the pole of the ecliptic, and the shorter, of course, at right angles to it. The consequence of this real motion of the pole is an apparent approach and recession of all the stars in the heavens to the pole in the same period; and the same cause will give rise to a small alternate advance and recession of the equinoctial points, by which both the longitudes and the right ascensions of the stars will be also alternately increased or diminished. This nutation, however, is combined with another motion—namely, the precession of the equinoxes—and in virtue of the two motions the path which the pole describes is neither an ellipse nor a circle, but a gently undulating ring, and these undulations constitute each of them a nutation of the earth's axis. Both these motions and their combined effect arise from the same physical cause, namely, the action of the sun and moon upon the protuberant mass at the earth's equator. See *precession*.

The phenomena of Precession and Nutation result from the earth's being not a spheroid, and therefore attracting the sun and moon, and experiencing reactions from them, in lines which do not pass precisely through the earth's centre of inertia, except when they are in the plane of its equator. *Thomson and Tait*, *Nat. Phil.*, § 825.

4. In *bot.*, same as *circumnutation*.

seed is thoroughly dried, the shell then cracked, and the olive-shaped kernel, about an inch in length, commonly treated with lime for preservation, becomes the nutmeg of commerce. 1. The fifteenth letter and fourth vowel in our alphabet. It followed *N* also in the Italian systems, but was separated from it in Greek and Phœnician by another character, which in the latter had the value of a sibilant, and in the former that of the compound *lv* (f). The *O*-character, accordingly, was the sixteenth in the Phœnician alphabet, and it represented there the 'ain, a very peculiar and to us unpronounceable guttural; the Greeks (as in the case of *E*: see that letter) arbitrarily changed its value to that of a vowel, corresponding in quality to our "long *o*". There is no traceable Egyptian prototype for the character, the comparison of older forms is therefore as follows:

It thus appears that the belief, not uncommonly held, that *O* represents, and is limited from, the rounded position of the lips in its utterance is a delusion. The historical value of the letter (as already noticed) is that of our *o*, in *note*, etc., whether of both long and short quantities, as in Latin and the earliest Greek, or of short only, as in Greek after the addition to that alphabet of a special sign for long *o* (namely *omega*, ω , ω). This vowel-sound, the name-sound of *o*, is found in English usage only with long quantity in accented syllables. There is no closely corresponding short vowel in standard English, but only in dialectal pronunciation, as in the New England utterance of certain words (much varying in number in different individuals); for example, *home*, *whole*, *none*. What we call "short *o*" (in *not*, *on*, etc.) is a sound of altogether different quality, very near to a true short *a* (that is, a short utterance corresponding to the *a* of *arm*, *father*), but verging slightly toward the "broad" *a* (that of *a* of *land*, *lord*). "Short *o*" has a marked tendency to take on a "broadened" sound, especially before *r*, and especially in America, hence the use, in the respellings of this work, of *o*, which varies in different mouths from the full sound of *a* to that of *e*. After these three values of the character, the next most common one is that of the *o*-sound, the original and proper sound of *u* (represented in this work by *u*), as in *move*, with the nearly corresponding short sound (marked \hat{o}) in a few words, as *well*, *woman*. All these *o*-sounds partake of what is usually called a "labial" or "rounded" character: that is to say, there is involved in the utterance a rounding and closing movement of the lips (and, it is held, of the whole mouth-cavity), in different degrees, — least of all in *e*, more and more in *o*, \hat{o} , \hat{u} ; in the last, carried to its extreme, no closer rounding and approximation being possible. The labial action helps to give the vowel-sounds in question their fully distinctive character; but it can be more or less alighted without leaving them unrecognizable, and, in the generally indifferent habit of English pronunciation, is in a degree neglected, even in accented syllables, and yet more in unaccented. Our "long *o*" should be added, regularly ends with a vanishing sound of *u* (*o*), as our *u* with one of *o*. *O* also has in many words the value of the "neutral" vowels of *but*, *hurt*; for example, in *son*, *come*, *love*, *work*. *O* is further a member of several very common and important digraphs: thus, *oo*, the most marked representative of the *o*-sound (in *moon*, *road*, etc.); *ou* (in certain situations *ow*), oftenest representing a real diphthong (in *out*, *sound*, *now*, etc.), but also a variety of other sounds (as in *through*, *could*, *ought*, *rough*); *oi* (in certain situations *oy*), standing for a real diphthongal sound of which the first element is the "broad" *o*- or *u*-sound (for example, *point*, *boy*), *oa* (*load*, etc.), having the "long" *o*-sound; others, *oo* (variously pronounced, as in *people*, *yeoman*, *jeopardy*, etc., in *o*, *does*, etc.), are comparatively rare.

A tree or shrub of the genus *Quercus*, a large and widely dispersed group, chiefly of forest-trees. In its nobler representatives the oak as "the monarch of the forest" has always been impressive, and it has lately held an important place in religious and civil ceremonies. Oak chaplets were a reward of civic merit among the Romans; the Druids venerated the oak as well as the mistletoe which grows upon it. The timber of many species is of great economic value, and the bark of several is used for tanning and dyeing and in medicine. (See *oak bark* and *quercetron*.) One species furnishes cork (see *cork*). The fruit-cups of some are used in tanning (see *oak*). (See also *oak*, *oak*, and *oak*.) The oak of English history and literature is chiefly the British oak *Quercus robur*, having two varieties, *pedunculata* and *astifolia*, often regarded as species. The species is distributed throughout a great part of Europe and in western Asia. It attains great age, with an extreme height of 120 feet. For ship-building its timber is considered invaluable, having the requisite toughness and most other qualities without extreme weight, and until recently it was the prevailing material of British shipping. It is also used for construction, cabinet-work, etc. Its bark is

L. *lolium* and *sicenta*); not found in other tongues. Some compare the leaf (dim.) *oittil*, a nodule in stone, = Norw. *oittel*, a knot, nodule, gland; also Russ. *yadro*, a kernel, ball, Gr. *oidor*, a swelling (see *edema*); the name being given, in this view, with ref. to its rounded shape. Others compare the AS. *etan*, E. *at* (cf. *at* = Icel. *ata*, also *ati*), meat, prey; but why oats should be singled out, as 'that which has a rounded shape' or 'that which is eaten,' from other grains of which the same is equally or more true, is not clear.] 1. (a) A cereal plant, *Avena sativa*, or its seed; commonly used in the plural in a collective sense. The oat was already in cultivation before the Christian era, and is sown in a variety of soils in all cool climates, degenerating

toward the tropics, yet not ripening quite as far north as barley. Oats are grown chiefly as food for beasts, especially horses, being most largely so used in the United States, but they also form an important human food (especially in Scotland, of late years somewhat in the United States) in point of nutrition ranked higher by some than ordinary grades of wheat flour. (See *oatmeal*, *groats*, and *oatmeal*.) All the varieties of the ordinary cultivated oat are referred to *A. sativa*, but this is believed by many to be derived from the wild oat, *A. fatua*. The rare called *naked oat*, sometimes regarded as a species, *A. nuda*, differs from other sorts in having the seed free from the glume. It is successful in Ireland, etc. but not in America. A variety well approved in both hemispheres is the potato oat, with a large white plump grain, the original of which was found growing accidentally with potatoes. The black Poland is another esteemed variety; the Tartarian and the Siberian are recommended for poor soils. The varieties are numerous, new ones constantly appearing.

When green grew oats and barley.

The country squire brewed at home that strong ale which, after dinner, stood on the table in decanters marked with the oat and was drunk in lieu of wine.
S. Dowell, Taxes in England, IV. 68.

(b) Any species of *Avena*. The wild oat of Europe, *A. fatua*, is a weed of cultivation in many places; in California where it abounds, it is extensively utilized as hay. The annual, dry, or hygrometric oat, *A. erodida*, native in Barbary, has two long, strong much-bent awns, which twist and untwist with changes of moisture, and so become a means of locomotion. Various species are more or less available for pasture.

oath; no other forms found; root unknown.]

1. A solemn appeal to the Supreme Being in
attestation of the truth of some statement or
the binding character of some covenant, un-
dertaking, or promise; an outward pledge that
one's testimony or promise is given under an
immediate sense of responsibility to God.

For the sign, He that swears the will deceive his Neigh-
bore; and therefore alle that that don, that don it with-
outen Othe.

Such an act

an appeal to God, he is immediate judge of it.

Dryden, Mind of Duke of Guise.

oath of fidelity as well as of office.

Bancroft, Hist. Const., II. 113.

2. The form of words in which such attestation
is made. Oaths are of two kinds: (a) assertory oaths, or
those by which something is asserted as true, and (b) prom-
issory oaths (see *promissory oath*, *oath of allegiance*, and
oath of office, below). Witnesses are allowed to take an
oath in any form which they consider binding on their
conscience. Provision is made in the cases of those who
have conscientious objections to the taking of an oath, or
those who are objected to as incompetent to take an oath,
whereby they are allowed to substitute an affirmation or
solemn promise and declaration. Oaths to perform ille-
gal acts do not bind, nor do they excuse the performance
of the act.

3. A light or blasphemous use of the name of
the Divine Being, or of anything associated
with the more sacred matters of religion, by
way of appeal, imprecation, or ejaculation.

Every boy wrenth it be annex to carter.

with the oath, blushed as he gave it in, and the Recording
Angel, as he wrote it down, dropped a tear upon the word,
and blotted it out forever. *Sterne, Tristram Shandy*, VI. 8.

4. Loosely — (a) An ejaculation similar in form
to an oath, but in which the name of God or of
anything sacred is not used.

Her pretty oath, by Yes and Nay.

Scott, Marmion, v. 11.

(b) An imprecation, differing from a curse in
its less formal and more exclamatory character;
it may be humorous, or even affectionate, among
rude and free-living men. (c) An exclamatory
word or phrase, usually without appropriate-
ness to the subject in hand, expressing surprise,
and generally displeasure, though sometimes
even approval or admiration. It may refer to some-
thing sacred, and even be what is called blasphemous, but
often wholly unmeaning, or a corruption or softening of
an originally blasphemous expression, as *zounds* for *God's*
(*Christ's*) *wounds*, *gad* for *by God*, etc. **Corporal oath.**

penalties, especially applied to the oath required by the
United States government from certain persons in civil

pathy therewith. **Judicial oath**, an oath administered in
a judicial proceeding, sometimes used as including any
oath taken before an authorized officer in a case in which
the law sanctions the taking of an oath. In contradistin-

abounded with obelisks, which were set up to record the honors or triumphs of the kings. And many have been removed thence, in both ancient and modern times. Two of the largest of them, about 73 feet in height, which had been erected by Senusert in Heliopolis, were removed to Rome by Augustus. Two obelisks in Alexandria, known as Cleopatra's Needles, were ordered by Mohammed Ali to Great Britain and France respectively. The French chose instead the Luxor obelisk, which was erected in the Place de la Concorde in Paris in 1835. That chosen by the British lay prostrate in the mud until it was removed and erected on the Thames embankment in London, in 1878, by private enterprise. Its height is 65 feet 4 inches, and its dimensions at the base are 7 feet 10 inches by 7 feet 6 inches. The companion obelisk was afterward presented to the city of New York, where it now stands in Central Park, having been transported thither in 1880 by private enterprise.

Small models of obelisks are found in the tombs of the age of the pyramid builders, and represented in their hieroglyphics.

A species of magical art or sorcery practised by the negroes in Africa, and formerly prevalent among those living in the West Indies, where it was introduced by African slaves. Traces of the same or similar superstitions and practices are still found both in the West Indies and in the southern United States. The harm used are bones, feathers, rags, and other trash, but it is upon a secret and skillful use of poison that the peculiar terror of the system is supposed to depend. The negroes have recourse to the obi for the cure of diseases, gratification of revenge, conciliation of enemies, discovery of theft, telling of fortunes, etc.

Things suffer in general: the slaves run away or are inclined to be turbulent, he [the bad head driver] and they cabal, bad enger is made, and perhaps the horrid and abominable practice of *obeah* is carried on, dismembering and disabling one another, even aiming at the existence of the white people.

5. In *gram.*: (a) A member of the sentence, a substantive word or phrase or clause, immediately (that is, without the intervention of a preposition) dependent on a verb, as expressing that on which the action expressed by the verb is exerted. The object of a verb is either *direct* or *indirect*. A direct object receives the direct action of the verb, and is in the accusative or objective case, so far as there is a distinctive form for that case, and a verb admitting such an object is called *transitive*: as, he saw me; they gave a book; an indirect object represents something (usually) to or for which the action is performed, and so is in the dative case, so far as that case is distinguished (as only imperfectly in English), thus, they gave her a book; I made the boy a coat; but in some languages indirect objects of other cases occur. A direct object which repeats in noun form an idea involved in the verb is called a *cognate object*: as, I dreamed a dream; they ran a race. The name *factive object* is often given to an objective predicate. See *predicate*. (b) A similar member of the sentence dependent on a preposition, i. e. joined by a preposition to the word it limits or qualifies: as, he went with me; a man of spirit. Such an object is in English always in the accusative or objective case; in other languages often in other cases, as genitive, dative, ablative. The object, whether of a verb or of a preposition, is said to be *governed*—that is, required to be of a particular case—by the verb or preposition.

6. The aspect in which a thing is presented to notice; sight; appearance. [*Rare.*]

He, advancing close
 Up to the lake, past all the rest, arose
 In glorious object.
Chapman.

The object of our misery is as an inventory to particularise their abundance.
Shak., Cor., I. 1. 21.

7. A deformed person, or one helpless from bodily infirmity; a gazing-stock. [*Colloq.*]

"What!" roars Macdonald—"You putr shaghtlin' in-kneed arady of a thing! Would any Christian body even you be object to a bonny sense weel-faured young woman like Miss Catline?"
Lockhart, Reginald Dalton, iii. 119.

8. An obstacle. [*Rare.*]

To him that putteth not an object or let (I use the school-men's words)—that is to say, to him that hath no actual purpose of deadly sin, (the sacraments) give grace, righteousness, forgiveness of sins.
Bacon, Works, iii. 280. (*Devot.*)

Eristical, exterior, external, first, formal, material, mediate, etc., object. See the *adjective*.
objectable (ob-jek'ta-bl'), *a.* [*< OF. objectabile: as object, v. + -able.*] Capable of being made or urged as an objection. [*Rare.*]

It is as *objectable* against all those things which either native beauty or art affords.
Jer. Taylor (7), Artif. Handsomeness, p. 145.

objection (ob-jek'ti-shon), *n.* [*< L. obiectio(n)-, a reproach, < obicere, reproach: see object.*] Reproach or cavi; captious objection.

All the knotty questions of the realm are referred to us, and, when they are discussed in the common hearing, each of us, without strife or objection, sharpens his wits to speak well upon them.
Peter of Hilde (trans.), in *Stubbs's Medieval and Modern Hist.*, p. 148.

object-finder (ob-jekt-fin'dér), *n.* In microscopes, a device to enable the observer to fix the position of an object in the slide under examination, so that he can find it again at will. It is especially necessary when high powers are employed. Various forms of finders have been devised; one of the most common involves the use of a slide with horizontal and vertical scales, adjusted in connection with the mechanical stage.

object-glass (ob-jekt-glás), *n.* In a telescope or microscope, the lens which first receives the rays of light coming directly from the object, and collects them into a focus, where they form an image which is viewed through the eyepiece. In the finest refracting telescopes the object-glass consists of an achromatic combination of lenses, formed of substances having different dispersive powers, and of such figures that the aberration of the one may be corrected by that of the other. Ordinarily the combination consists of a convex lens of crown-glass and a concave lens of flint-glass, having focal length the proportional to their dispersive powers. There are many different forms which fulfil the condition indicated, but vary in the curves of the lenses, their thickness, their relative position, and the distance between them. With the ordinary crown- and flint-glass it is not possible to obtain perfect achromatism; with the new kinds of glass made at Jena a much more perfect correction is possible, and it is likely that as a result telescopes will soon be greatly improved, provided the glass can be made in pieces of sufficient size and satisfactorily homogeneous. See *objective*, *n.*, 3, and *cut* under *microscope*.

objectification (ob-jek'ti-fi-ká'shon), *n.* [*< objectify + -ation (see -fication).*] The act or process of objectifying or of making objective. Also *objectivation*.

The diminution or increase of that which is perceived (of course, unreflectingly) as the area of self-assertion, or (if we like the phrase) as "the objectification of the will," is essentially and immediately connected with our own discomfort or pleasure.
F. H. Bradley, Ethical Studies, p. 254.

objectify (ob-jek'ti-fi), *v. t.*; and *pp. objectified, pp. objectifying*. [*< M.L. obiectum, an object, + L. -ficare, make: see object and -fy.*] To make objective; present as an object; especially, to constitute as an object of sense; give form and shape to as an external object; externalize. Also *objecturate, objectize*.

Because it [mind] is bound to think a coexistence or sequence, it *objectifies* the necessity.
Mauley, Body and Will, p. 157.

He may be quite innocent of a scientific theory of vision, but he *objectifies* his sensations.
T. H. Green, Prolegomena to Ethics, § 12.

What we start with in the child is the feeling of himself affirmed or negated in this or that sensation; and the next step . . . is that the content of these feelings is *objectified* in things.
F. H. Bradley, Ethical Studies, p. 251.

objection (ob-jek'ti-shon), *n.* [= *F. objection = Sp. objecion = Pg. objecção = It. obbiezione, obbiezione, < L.L. obiectio(n)-, a throwing or putting before, a reproaching, M.L. an objection, < L. obicere, obicere, pp. obiectus, throw before, object: see object, v.*] 1. The act of objecting or throwing in the way; the act of resisting by words spoken or written, by or without stating adverse reasons or arguments, advancing criticisms, or suggesting difficulties, etc.

Sheridan, The Rivals, I. 2.

2. That which is interposed or presented in opposition; an adverse contention, whether by or without stating the opinion, reason, or argument on which it is founded: as, many *objections* to that course were urged; the *objections* of the defendant were overruled.

As for your pitiful false objections,
 Prove them, and I lie open to the law.
Shak., 2 Hen. VI., I. 2. 168.

Objections to my general System
 May rise perhaps; and I have mist them.
Prior, Alma, ii.

He (Mr. Gladstone) has no *objections*, he assures us, to active inquiries into religious questions.
Macaulay, Gladstone on Church and State.

3. An adverse blow; an attack.
 The parts either not armed or weakly armed were well known, and, according to the knowledge, should have been sharply visited but that the answer was as quick as the objections.
Sir P. Sidney, Arcadia, I.

4. Trouble; care; cause of sorrow or anxiety.
 Our way is troublesome, obscure, full of objection and danger.
Jer. Taylor, Works (ed. 1835), I. 24.

objectivation (ob-jek'ti-vā'shun), *n.* [*objectivate + -ion.*] Same as *objectification*.

objective (ob-jek'tiv), *a. and n.* [= *F. objectif* = *Sp. objetivo* = *Pg. objetivo* = *It. obiettivo*, *obiettivo*, *ML. objectivus*, relating to an object, *objectum*, an object: see *object*, *n.* Cf. *subjective*.] *I. a. 1.* As perceived or thought; intentional; ideal; representative; phenomenal: opposed to *subjective* or *formal*—that is, as in its own nature. [This, the original meaning which the Latin word received from *Dante* about 1300, almost the precise contrary of that now most usual, continued the only one till the middle of the seventeenth century, and was the most familiar in English until the latter part of the eighteenth.]

Natural phenomena are only natural appearances. They are, therefore, such as we see and perceive them. Their real and objective natures are therefore the same. *Berkeley.*

The faculty of the imagination, for example, and its acts were said to have a subjective existence in the mind; while its several images or representations had, qua images or objects of consciousness, only an objective. Again, a material thing, say a horse, qua existing, was said to have a subjective being out of the mind; qua conceived or known, it was said to have an objective being in the mind. *Mr W. Hamilton, in Reid's Supplementary Dissertations, [note B, § 1.]*

Where or when should we be ever able to search out all the vast treasures of objective knowledge that laya within the compass of the universe? *Sir M. Hale, Orig. of Mankind, p. 156.*

[By objective knowledge was meant the propositions known, opposed to *formal* or *subjective* knowledge, the art or habit of knowing. Such expressions probably led to the change of meaning of the word.]

2. Pertaining or due to the real object of cognition; real: opposed to *subjective* (pertaining or due to the subject of cognition, namely, the mind). [This meaning of the word nearly reverses the original usage, yet if such passages as that from *Sir M. Hale*, above, on the one hand, and that from *Watts*, below, on the other, be compared, the transition will be seen to have been easy. Kant makes the objects of experience to be at once real and phenomenal; and what he generally means by the objective character of a proposition is the force which it derives from the thing itself compelling the mind, after examination, to accept it. But occasionally Kant uses *objective* to imply a reference to the unknowable thing-in-itself to which the compelling force of phenomena is due.]

Objective certainty is when the proposition is certainly true in itself, and subjective when we are certain of the truth of it. The one is in things, the other is in our minds. *Watts, Logic, II. 2. § 8.*

[Thus, there is an objective certainty in things that any given man will die; and a subjective certainty in his mind of that objective certainty.]

Objective means that which belongs to, or proceeds from, the object known, and not from the subject knowing, and thus denotes what is real, in opposition to what is ideal, what exists in nature, in contrast to what exists merely in the thought of the individual.

Sir W. Hamilton, Metaph., ix.
A form of consciousness, which we cannot explain as of natural origin, is necessary to our conceiving an order of nature, an objective world of fact from which illusion may be distinguished.

T. H. Green, Prolegomena to Ethics, § 19.

If an exact objective measurement of the physical stimulus is intrinsically difficult, an exact subjective measurement of the sensations themselves is inherently impossible. *G. T. Ladd, Physiol. Psychology, p. 361.*

The number of vibrations is the objective characteristic of that which we perceive subjectively as colour. *Lommel, Light (trans.), p. 226.*

3. Substantive; self-existent. [This rather confusing use of the word belongs to writers of strong nominalistic tendencies.]

Science . . . agrees with common sense in demanding a belief in real objective bodies, really known as causes of the various phenomena the laws and interrelations of which it investigates. *Misart, Nature and Thought, p. 60.*

The only other thing in the physical universe which is conserved in the same sense as matter is, conserved, is energy. Hence we naturally consider energy as the other objective reality in the physical universe.

Quell, in Encyc. Brit., XV. 747.

4. Intent, as a person, upon external objects of thought, whether things or persons, and not watching one's self and one's ways, nor attending to one's own sensations; setting forth, as a writing or work of art, external facts or imaginations of such matters as they exist or are supposed to exist, without drawing attention to the author's emotions, reflections, and personality.

The only healthful activity of the mind is an objective activity, in which there is as little brooding over self as possible. *J. Fiske, Cosmic Philos., I. 142.*

The two epics [the *Iliad* and *Odyssey*] appear on the horizon of time so purely objective that they seem projected into this visible diurnal sphere with hardly a subjective trace adhering to them, and are silent as the stars concerning their own genesis and mutual relation.

W. D. Gifford, Problem of the Homeric Poems, II.

The theme of his [Dante's] poem is purely subjective, modern, what is called romantic; but its treatment is objective (almost to realism, here and there), and it is limited by a form of classic severity.

Lancel, Among my Books, 2d ser., p. 37.

5. In *gram.*, pertaining to or noting the object of a transitive verb, or of a preposition; forming or expressing a grammatical object: as, the objective case; an objective phrase or clause. Abbreviated *obj.*—Objective abstraction, beatitude, being, doubt. See the nouns. — Objective cause, the external object which excites the principal cause of any effect to action; the precatatorial cause. — Objective concept, a concept conceived as constituting a real likeness among the objects which come under it, opposed to a *formal concept*, or the concept regarded merely as a function of thought. — Objective end, end, evidence, idealism, etc. See the nouns. — Objective line, in *persp.*, any line drawn on the geometrical plane the representation of which is sought in the draft or picture. — Objective logic, the logic of objective thought; the general account of the process by which the interaction of ideal elements constitutes the world. *Hegel.* — Objective method, the inductive method: the method of modern science. — Objective philosophy. Same as *transcendental philosophy* (which see, under *philosophy*). — Objective plane, any plane, situated in the horizontal plane, whose perspective representation is required. — Objective point. (a) The point or locality aimed at; the final or ultimate point to which or to reach which one's efforts or desires are directed; specifically (*midst*), the point toward securing which a general directs his operations, expecting thereby to obtain some decisive result or advantage. Hence — (b) The ultimate end or aim; that toward the attainment of which effort, strategy, etc., are directed. — Objective power or potency, that of a consistent object of thought; logical possibility; non-existence combined with non-repugnance to existence. — Objective reality, the reference of a concept to an object. — Objective reason or thought, in *metaph.*, reason or thought as existing not in the individual mind, but as in the real objects of cognition.

A truly objective thought, far from being merely ours, must at the same time be what we have to discover in things, and in every object of perception.

Hegel, tr. by Wallace, Logic of the Encyclopedia, § 41.

Objective symptoms, in *med.*, symptoms which can be observed by the physician, as distinct from *subjective symptoms*, such as pain, which can be directly observed only by the patient. — Objective truth, the agreement of a judgment with reality; material truth. — Objective validity, applicability to the matter of sensation.

There therefore arises here a difficulty which we did not meet with in the field of sensibility, namely how subjective conditions of thought can have objective validity; that is, become conditions of the possibility of the knowledge of objects.

Kant, Critique of Pure Reason (tr. by Max Müller, orig. [ed.], p. 60.)

II. n. 1. In *Eng. gram.*, the objective case; the case used to express the object of a verb or a preposition. This case answers in most of its uses to the accusative of Greek, Latin, German, and other languages, and is sometimes so called in English. In nouns it is never distinct in form from the subjective or nominative; the only objectives having such a distinct form are the pronominal case-forms *me, thee, him, her, us, them, whom*, corresponding to the nominatives *I, thou, he, she, we, they, who* respectively. Of these, *he* happens to be the same in form as the pronominal *who*. When words expressing extent in space or duration in time are put in the objective, they are called *adverbial objectives*, as, *he ran a mile*; *she sang an hour*. Compare *objective object*, under *object*, *s.* Abbreviated *obj.*

2. An objective point; especially, the object, point, or place to or toward which a military force is directing its march or its operations.

In 1864 the main objectives were Lee's and Johnston's armies, and the critical point was thought to be Richmond or Atlanta, whichever should be longest held.

The Century, XXXV. 606.

3. The lens, or practically the combination of lenses, which forms the object-glass of an optical instrument, more particularly of the microscope (see *object-glass*). Objectives are generally named from the focal length of a single lens which would have the same magnifying power: as, a two inch objective of power, a one half-inch objective (or simply a half), etc. Objectives of high magnifying power and consequently short nominal focal length (e. g., less than half an inch) are often spoken of as *high powers*, in distinction from the *low powers*, which magnify less and have longer nominal focal lengths. Objectives are also characterized as *immersion objectives* or *dry objectives* according as they are used with or without a drop of liquid between the lens

and the object; if the liquid has sensibly the same refractive power as the glass of the lens, the system is called *homogeneous immersion*. (See *immersion*, *s.*) The properties of an objective which determine its value for practical work are—definition or defining power, depending upon its freedom from spherical and chromatic aberration, which should be accompanied by flatness of field, *penetration*, the power of bringing parts of the object at different levels into focus at once; resolving power, the ability (depending upon the size of the aperture and the definition) to exhibit the minute details of structure, as the lines on a diatom frustule (see *test-object*); working distance, which is the space separating the lens and the object when the latter is in focus. These properties are in some degree antagonistic: thus, an increase in the aperture, and hence of the resolving power, is accompanied by a decrease in the working distance. The aperture of an objective is often measured by the angle of the cone of rays which it admits, and is then called *angular aperture*. Since, however, this angle varies according as it is used as a dry, water-immersion, or homogeneous immersion objective, a common measure is obtained, as proposed by Abbe, by taking the product of the half-angle into the refractive index of the medium employed: this is called the *numerical aperture* (sometimes written *N. A.*). Thus, for the maximum air-angle of 180°, which is equivalent to a water-angle of 97° 31' and a balsam-angle of 82° 17', the numerical aperture is unity, while for the respective angles of 60° (air), 44° 10' (water), 38° 34' (balsam), it is 0.5. Again, a numerical aperture of 1.33 corresponds to the maximum water-angle of 180° and a balsam-angle of 132° 6'. — *Endomersion-objective*, a form of objective, or object-glass, devised by Zeiss, in which the chromatic aberration is removed by the employment of a liquid (as a mixture of ethereal and fatty oils) placed between the separate lenses.

The character, in a work of art or in its author, of being objective, in the sense of dramatic, presenting things as they are and persons as they seem to themselves and to one another.

See *objective*, *a.*

The Greek philosophers alone found little want of a term precisely to express the abstract notion of *objectivity* in its indeterminate universality, which they could apply, as they required it, in any determinate relation. *Sir W. Hamilton (in Reid), Supplementary Dissertations, [note B, § 1.]*

Preponderant objectivity seems characteristic of the earlier stages of our consciousness, and the subjective attitude does not become habitual till later in life.

object-soul (ob-jek't-sol), *n.* In *anthropology*, a soul or vital principle believed by many barbarous tribes to animate lifeless objects, and generally imagined as of a phantom-like, attenuated materiality, rather than as of a purely spiritual character.

2. *Ecclési.*, a loaf of unconsecrated bread prepared for use at the celebration of the eucharist; altar-bread. From the earliest times of which we have distinct information, *oblates* have been circular in form, of moderate thickness, and marked with a cross or crosses. In the Western Church they are unleavened, much reduced in size, and commonly known as *wafers*, or, especially after consecration, as *hosts*. In the Anglican Church the use of leavened bread in loaves of ordinary size and form was permitted at the Reformation, and became the prevalent though not exclusive use. The Greek Church uses a circular oblate of leavened bread, in the center of which is a square projection called the *Holy Lamb*. This projecting part alone is consecrated, and the remainder serves for the antidoron. — *Oblate roll*, in *Eng. Hist.*, the account kept in the exchequer, particularly in the reigns of John and Henry III., of old debts due to the king and of gifts made to him.

An important musical instrument of the wood wind group, and the type of the family in which the tone is produced by a double reed. In its modern form it consists of a wooden tube of conical bore, made of three joints, the lowest of which is slightly flaring or bellied, while the uppermost carries in its end the metal staple with its reeds of cane. The number of finger holes varies considerably: in the larger varieties they are principally controlled by an intricate system of levers. The extreme compass is nearly three octaves, upward from the *fp* or *ff* next below middle *C*, including all the semitones. The tone is small, but highly individual and penetrating. It is especially useful for pastoral effects, for plaintive and wailing phrases, and for giving a reedy quality to concerted passages. The normal key (tonality) of the orchestral oboe is *G*, and music for it is written with the *G* clef. The oboe has borne various names, such as *chalumeau*, *schalmey*, *shawm*, *tombarde piccola*, *hautboy*, etc. It has been a regular constituent of the modern orchestra since early in the eighteenth century, and is the instrument usually chosen to give the pitch to others. It has also been used to some extent as a solo instrument. The oboe family of instruments includes the oboe d'amour, the oboe da caccia or cocusoon, the English horn, and the bassoon.

Its normal key was *F*. The tone was similar to that of the bassoon, but lighter. Also called *tenoroon* and *fagottino*.

In these sciences which describe and explain provinces of the universe as it exists, such as astronomy and systematic biology, observations are, for the most part, made under circumstances or conditions which may be selected, but cannot be produced at will. But in those sciences which analyze the behavior of substances under various conditions it is customary first to place the object to be examined under artificially produced conditions, and then to make an observation upon it. This whole performance, of which the observation is a part, is called an experiment. Formerly sciences were divided into sciences of experiment and sciences of observation, meaning observation without experiment. But now experiments are made in all sciences. It is only occasionally that the word observation has been used to imply the absence of experimentation.

Syn. Difficulty, *Obstacle*, *Obstruction*, *Impediment*, *check*, *barrier*. A difficulty, an embarrassment, an obstacle stops us. We remove (or overcome) the one we surmount the other. Generally the first expresses something arising from the nature and circumstances of the affair; the second something arising from a foreign cause. An obstruction blocks the passage, and is generally put in the way intentionally. An impediment literally clogs the feet and so may continue with one, hindering his progress, while a difficulty once overcome, an obstacle once surmounted, or an obstruction once broken down, leaves one free to go forward without hindrance.

-Syn. 1. *Obstinate, Stubborn, Intractable, Refractory, Contumacious, pertinacious, headstrong, unyielding, dogged, wilful, persistent, immovable, inflexible, firm, resolute.* The first five words now imply a strong and vicious or disobedient refusal to yield, a resolute or unmanageable standing upon one's own will. *Stubborn* is strictly negative: a stubborn child will not listen to advice or commands, but perhaps has no definite purpose of his own. *Obstinate* is active: the obstinate man will carry out his intention in spite of advice, remonstrance, appeals, or force. The last three of the italicized words imply disobedience to proper authority. *Intractable*, literally not to be drawn, handled, or governed, is negative; so is *refractory*: both suggest sullenness or perverseness; *refractory* is more appropriate where resistance is physical: hence the extension of the word to apply to metals. *Contumacious* combines pride, haughtiness, or insolence with disobedience; in law it means wilfully disobedient to the orders of a court.

The rapid deterioration of the vents of heavy guns in firing the large charges now in vogue renders it indispensable that some vent-sealing device be employed to prevent the rush of gas through the vent. The most convenient way of effecting this obturation of the vent is through the action of the primer by which the piece is fired.

Gen. & F. Beatt, in *Rep. of Chief of Ordnance*, 1884, p. 18.

It is in some animals wholly external, constituting a second obturator externus. The obturator muscles form part of a set of six muscles, known in human anatomy as *rotatores femoris* from their action upon the thigh-bone, which they rotate outward upon its axis.—**Obturator ligament**, the obturator membrane.—**Obturator membrane**. See *membrane*.—**Obturator nerve**, a branch of the lumbar plexus, arising from the third and fourth lumbar nerves, and distributed principally to the hip and knee joints and to the adductor muscles of the thigh.—**Obturator tertius**, the third obturator muscle of some animals, as the hyrax, arising from the inner surface of the ischium, and passing through the obturator foramen to the trochanteric fossa of the femur.—**Obturator vein**, a tributary to the internal iliac vein, accompanying the artery.

He was a great advocate of the rule of poverty of the Franciscan order, to which he belonged, and a strong defender of the state against the pretensions of the papacy. All his teachings depend upon the logical doctrine that generally belongs only to the significations of signs (such as words). The conceptions of the mind are, according to him, objects in themselves, individual, but naturally aggregative of classes. These principles are carried into every department of logic, metaphysics, and theology, where their general result is that nothing can be discovered by reason, but all must rest upon faith. Occamism thus prepared the way for the overthrow of scholasticism, by arguing that little of importance to man could be learned by scholastic methods; yet the Occamist writings exhibit the scholastic faults of triviality, prolixity, and formality in a higher degree than those of any other school.

Browne, Vulg. Err.*, II, 6.

2. In *physics* and *chem.*, to absorb; specifically applied to the absorption of a gas by a metal, such as iron, platinum, or palladium, particularly at a high temperature. Thus, palladium heated to redness and cooled in a current of hydrogen absorbs or *occludes* over 100 times its volume of the gas. By this means the physical properties of the metal are changed, and the occluded hydrogen is regarded as existing in a solid form as a quasi-metal, called *hydride*, the specific heat, specific gravity, and electrical conductivity of which have been approximately determined. Probably a part of the gas forms also a definite chemical compound with the metal. Occluded gases also occur in meteorites. Thus, the Arva meteoric iron yielded (Wright) 47 volumes of the mixed gases carbon dioxide, carbon monoxide, hydrogen, and nitrogen.

Professor Graham has shown its (palladium's) remarkable power of absorbing hydrogen. When a strip of palladium is made the negative electrode in an apparatus for decomposing water, it absorbs 500 or 600 times its volume of hydrogen, expanding perceptibly during the absorption. This occluded gas is again given off when the substance, which Professor Graham believed to be an actual alloy of palladium and hydrogen, is heated to redness. *Nelson*.

Not apparent upon mere inspection, nor deducible from what is so apparent, but discoverable only by experimentation; relating to what is thus undiscoversable by mere inspection: opposed to *manifest*. The Latin word was applied in the middle ages to the physical sciences and the properties of bodies to which those sciences relate. Its precise meaning is explained in the treatise "De Magico" of Petrus Borellus. He says that an *occult* quality is simply one which is made apparent only upon experimentation, but that in that way it becomes as plain and clear as any other quality, and is no more mysterious. By *occult science* or *philosophy* was meant simply experimental science. There were many occult philosophers in northern Europe in the twelfth and the first part of the thirteenth century, but theology so swallowed up other interests that they are all forgotten except Roger Bacon, who was made prominent by the personal friendship of a pope. The ignorance and superstition of the time confounded occult science with magic.

There are manifest qualities, and their causes only are occult. *Newton*, *Opticks*.

occupancy (ok-u-pān-si), *n.* [*< occupant* + *-cy*.] 1. The act of taking possession, or the being in actual possession; more specifically, in *law*, the taking possession of a thing not belonging to any person, and the right acquired by such act; that mode of acquiring property which is founded on the principle that he who takes possession of an ownerless thing, with the design of appropriating it to himself, thereby becomes the owner of it; the act of occupying or holding in actual as distinguished from constructive possession. Formerly, when a man held land *per autre vie* (for the life of another), and died before that other, as his estate could not descend to his heir nor revert to the donor until the determination of the specified life, it was considered to belong of right to the first who took possession of it for the remainder of the life, and such possession was termed *general occupancy*. And when the gift was to one and his heirs for the life of another, the heir was said to take as *special occupant*. As the law now stands, however, a man is enabled to devise lands held by him *per autre vie*, and if no such devise be made, and there be no special occupant, it goes to his executor or administrators.

As we before observed that *occupancy* gave the right to the temporary use of the soil, so it is agreed upon all hands that *occupancy* gave also the original right to the permanent property in the substance of the earth itself, which excludes every one else but the owner from the use of it. *Blackstone*, *Comm.*, II, 1.

2. *Occupation*, *Calling*, *Vocation*, *Employment*, *Profession*, *Business*, *Trade*, *Craft*, *Profession*, *Office*. In regard to what a person does as a regular work or a means of earning a livelihood, *occupation* is that which occupies or takes up his time, strength, and thought. *calling* and *vocation* are high words, indicating that one is called by Providence to a particular line of work. *calling* is Anglo-Saxon and familiar, and *vocation* is Latin and lofty (the words are not always used in the higher sense of divine appointment or the call of duty, but it is much better to save them for the expression of that idea). *employment* is essentially the same as *occupation*; *profession* is the line of work which one pursues or follows: *business* suggests something of the management of buying and selling, *trade* and *profession* stand over against each other for the less and more intellectual pursuits, as the *trade* of a carpenter, the *profession* of an architect, *trade* is different from a *trade*, the latter being skill in some handicraft, as, being obliged to learn a *trade*, he chose that of a blacksmith, the "learned *professions*" used to be *law*, *medicine*, and the *ministry*, but the number is now increased. *craft* is an old word for a *trade*; *office* suggests the idea of duties to be performed for others. ocean (o'shan), n. and a. [*< ME. ocean, ocean, ocean, ocean, < OF. ocean, ocean, ocean, ocean, F. océan = Sp. oceano = Pg. oceano = It. oceano = D. oceaan = G. Ozean, orig. (in Homer) the great stream supposed to encompass the earth (also called by Homer Ὠκεανὸς ποταμός, or Ὠκεός, 'Ocean-stream' (Milton); also personified, Oceanus, the god of the primeval waters; later, the great outward sea, the Atlantic, as distinguished from the inward sea, the Mediterranean; perhaps orig. 'swift' < ὠκεός, swift.)] **I. n. 1.** The body of water which envelops the earth, and covers almost three-fourths of its surface with a mean depth—as nearly as can be estimated at the present time—of less than 12,500 feet. Physical geographers, following the lead of the Royal Geographical Society, generally divide the entire oceanic area into five distinct oceans, namely the Arctic, Antarctic, Atlantic, Pacific, and Indian; but these divisions are largely artificial, the lines by which they are indicated being in no small part parallels and meridians. The Arctic and Antarctic oceans, according to this scheme, extend from the north and south poles respectively to the Arctic and Antarctic circles. The Atlantic extends between the two polar circles, being limited on the east by the land masses of Europe and Africa and by the meridian extending from Cape Agulhas to the Antarctic circle, and on the west by the American land-mass and the meridian of Cape Horn. The Pacific has as its land limits on the east the American coast, and on the west the Asiatic land-mass, the Philippine Islands, New Guinea, and Australia. Its imaginary limits are the meridians of Cape Horn and the south Cape of Tasmania prolonged to meet the Antarctic circle. The Indian ocean extends south from the Asiatic mainland to the Antarctic circle, its eastern and western imaginary limits having been already given in defining those of the Pacific and Atlantic. Thus, as will be noticed, there are no natural limits on the south of either the Atlantic, the Pacific, or the Indian ocean, since these all unite with the Antarctic ocean to form one continuous area of water. Hence it would be more philosophical to call the vast area of water occupying the chief part of the southern hemisphere the Southern ocean, as has been done by Herschel and Thomson, and to consider the Atlantic, Pacific, and Indian oceans as immense gulfs or prolongations toward the north of the still greater Southern ocean. The Pacific ocean was most generally designated by the older English navigators as the "South Sea" and this name is still current among the Germans. The Atlantic and Pacific are also generally divided into North and South Atlantic and North and South Pacific by the equatorial line. The smaller divisions of the ocean are, in the order of their respective magnitudes, seas, gulfs, bays, sounds, straits, coves, holes, and harbors (see each of these words). The mean depth of the ocean is probably not far from six times the mean elevation of the land above the ocean-level. The deepest soundings of the ocean, however, give figures a little inferior in amount to those indicating the elevation of the very highest mountain summits. In several different parts of the ocean depths of over 26,000 feet have been sounded, and one sounding of 31,614 feet (depth greater than the height of Mt. Everest) has been made near the island of Guam. (See deep-sea sounding-machine, under deep-sea.) The oceanic currents are of great importance in their effects on climate. The principal surface current in the equatorial, due to the action of the trade winds, by which the water is continually urged westward, but, being driven in its westerly course against the land masses, it is deflected by them, and forced to perform an immense gyration by which it returns into the general system far to the eastward. Owing to the shape of the land masses in the northern hemisphere, these modifications of the equatorial current are much more distinct and important than they are to the south of the equator. Two of the oceanic currents are especially interesting, the Gulf Stream of the Atlantic and the Kuroshio of the Pacific (see these terms). The surface temperature of the ocean varies greatly in the different latitudes and with the strength and direction of the surface currents, the Gulf Stream playing a most important part in ameliorating the climate of northwestern Europe by means of the heated surface water which it carries from the equatorial regions. Besides these surface currents, however, there is a general exchange of water always going on in the depths of the ocean between the warmer equatorial and the colder polar waters, brought about by the dif-*

Seas is specific gravity of the sea. As the result of this, it is found that the temperature of the ocean as a rule diminishes as greater depths are attained, and that the deeper parts, where open to the general circulation, are near the freezing-point. A remarkable feature of the ocean-water is the uniformity in the nature and quality of the salts which it contains, provided the specimen has been taken at considerable distance from land. The weight of the salts held in solution by the main ocean is about 34 per cent. of the whole; of this about three quarters is common salt, one tenth chlorid of magnesium, one twentieth sulphate of magnesia, about the same sulphate of lime, one twenty-fifth chlorid of potassium, and a little over one per cent. bromide of sodium. Other substances are also present in smaller quantity, making in all about twenty-nine elements which have been detected in the ocean-water; many of these, however, exist only in very minute traces. The economical value of the ocean as a source of supply for common salt is considerable, but the quantity thus obtained is not so great as that furnished by mines of rock-salt or by the evaporation of brine got by boring. See salt.

class of natural earths consisting of mixtures of the hydrated sesquioxides of iron with various earthy materials, principally silica and alumina. These mixtures occur in many localities and have many shades of color, among which tints of red, reddish brown, yellow, and orange are most common. They form a series of valuable and important pigments, used extensively alike by house painters and artists both in oil and in water-colors. The most usual and common type of ocher-color is a yellow turning neither to red on the one hand nor to brown on the other, but its tone is not as brilliant nor as pure as chrome-yellow. (For varieties, see below.) Ochers in general have much body and are very permanent. Most ochers on burning become redder and darker. Raw stenna and raw umber are varieties of ocher. 2. Money, especially gold coin; so called in allusion to its color. [Slang.]

 average number of days in the year was thus made up to

Cf. *outas*.] I. *n.* 1. (a) The eighth day from a festival, the feast-day itself being counted as the first; as, Low Sunday is the octave of Easter. The octave necessarily falls on the same day of the week as the feast from which it is counted.

The octave of the consecration-day had barely passed, and there was already a King to be buried.

R. A. Freeman, Norm. Conq., III. 17.

(b) The prolongation of a festival till the eighth day inclusive; a period consisting of a feast-day and the seven days following; as, St. John the Evangelist's day (December 27th) is within the octave of Christmas. See *outas*.

Hereupon therefore he caused a parliament to be summoned at Westminster, there to be holden in the octaves of the Epiphany. (Holinshed, Hen. III., an. 1225.)

To touch the earth with our foot within the octaves of Easter, or to taste flesh upon days of abstinence, . . . have no consideration if they be laid in balance against the crimes of adultery or blasphemy.

Jer. Taylor, Works (ed. 1835), I. 63.

2. In music: (a) A tone on the eighth diatonic degree above or below a given tone; the next higher or lower replicate of a given tone. (b) The interval between any tone and a tone on the eighth degree above or below it. (c) The harmonic combination of two tones at the interval thus described. (d) In a scale, the eighth tone from the bottom, or, more exactly, the tone with which the repetition of the scale begins; the upper key-note or tonic; the eighth; solmized *do*, like the lower key-note. The typical interval of an octave is that between any tone and its next replicate, which is acoustically represented by the ratio 1:2, that is, in number of vibrations . . . and is equal to six diatonic whole steps or to twelve semitones. Such an octave is called *perfect* or *major*; an octave one half-step shorter is called *diminished* or *minor*; an octave one half-step longer is called *augmented*. The perfect octave is the most complete consonance after the unison. Indeed, its completeness is often regarded as belonging to a different category from that of the other perfect consonances, except the unison, since it amounts rather to a repetition or reinforcement of the original tone at a higher or lower pitch than to a combination of a new or different tone with it; hence the term *replicate*. In harmony the parallel motion of two voices parts in perfect octaves is forbidden, except where the mere reinforcement of one voice by another is desired: such octaves are called *consecutive octaves*. See *consecutive intervals*, under *consecutive*. (e) In a standard system of tones selected for artistic use, a division or section or group of tones an octave long, the limits of which are fixed by reference to a given or assumed standard tone whose exact pitch may be defined. The tone usually assumed as a starting-point is middle *C* (written on the first ledger line below in the treble clef, and on the first above in the bass clef). The octave beginning on the next *C* below is called the *tenor* or *small octave*; that beginning on the second *C* below is called the *bass* or *great octave*; that beginning on the third *C* below is called the *contrabass octave*; while that beginning on middle *C* itself is called the *alto*, *once marked* or *once-octave octave*; that beginning on the next *C* above is called the *treble*, *twice marked*, or *twice-octave octave*, etc. See the accompanying table:

The acceptance of the octave as the best unit for thus dividing the series of recognized tones into sections of equal length and value has not been uniform. Ancient Greek music seems to have first used the tetrachord as such a unit; while medieval music employed the hexachord in the same way. The subdivision of the octave portions themselves has also varied greatly in different systems of music. See *scale*. (f) In organ-building, a stop whose pipes give tones an octave above the normal pitch of the digitals used; specifically, such a stop of the diapason variety. Also known as the *principal*. Also called *octave-flute*, *octave-stop*.—3. Any interval resembling the musical octave in having the vibration-ratio of 1:2.

If . . . the solar spectrum be considered in its whole extent, we find in the ultra red alone, according to Muller, more than two octaves, to which must be added more than another octave from A to the line R in the ultra violet. The whole length of the solar spectrum thus embraces consequently about four octaves.

Lammell, Light (trans.), p. 21.

Specifically, in *veridification*: (a) A stanza of eight lines; especially, the *ottava rima* (which see).

With mournful melody it continued this octave.

Sir P. Sidney, Arcadia, III.

(b) The first two quatrains or eight lines in a sonnet. See *sonnet*.

It requires no doubt considerable ingenuity to construct a satisfactory sonnet running upon two rhymes in the octave and two in the sestet. (Allan Cunningham, No. 314, p. 12.)

4. A small cask of wine containing the eighth part of a pipe.—At the octave, all octava, *Sp.*, in musical notation. See *octave*.—Broken octaves, in piano-

forte and organ music, a passage of octaves the two tones of which are played successively instead of together; as,

Covered or hidden octaves, in music, the consecutive octaves that are suggested when two voices proceed in similar (not parallel) motion to a perfect octave. Hidden octaves are forbidden in strict counterpoint, and dissonances in simple harmony, particularly if both voices skip. Compare *hidden fifth*, under *fifth*.—Rule of the octave, in the musical theory of the seventeenth and eighteenth centuries, an arbitrary and imperfect scheme of the harmonies proper to the successive tones of the scale. The modern theory that every tone of the scale may be made the basis of a triad has completely displaced this rule.—Short octave, in early organ-building, the lowest octave of the keyboard when made to consist of only three or four of the digitals most used in the music of the day, instead of the full number. The digitals were set close together, as if belonging to the regular series. This curtailment was simply to avoid the expense of large pipes.

II. *a.* Consisting of eight; specifically, consisting of eight lines.

Isocace . . . particularly is said to have invented the octave rhyme, or stanza of eight lines.

Dryden, Pref. to Fables.

The remainder [is] partly in prose and partly in octava stanzas. (Tichnor, Span. Lit., I. 40.)

II. *n.* A book or pamphlet every section or gathering of which contains eight leaves, each leaf supposed to be one eighth of the sheet printed; usually written *8vo*. When the name of the paper of which the book is made is not specified, an octavo is understood as a medium octavo, 6 x 9 inches. Smaller octavos are—post 8vo, 6½ x 8½ inches; demy 8vo, 5½ x 8 inches; crown 8vo, 5 x 7½ inches; cap 8vo, 4½ x 7 inches. Larger octavos are—royal 8vo, 6½ x 10 inches; superroyal 8vo, 7 x 11 inches; imperial 8vo, 8½ x 11½ inches. These are regular octavo folds of established sizes of paper in the United States. Publishers and booksellers describe as octavo only those books or leaves that are larger than 6½ x 8 and smaller than 7½ x 11½ inches, irrespective of the number of leaves in a section, which may be twelve or sixteen on thin paper and four or six on thick paper. Larger sizes are described as 4to, smaller sizes as 12mo or 16mo. Bibliographers, as a rule, limit the use of the word *octavo* to books having sections of eight leaves or sixteen pages.

In constitutional provisions and statutes regulating the appointment, tenure, emoluments, etc., of public officers, the designations "officers," "civil officers," "public officers," "executive officers," "judicial officers," "legislative officers," "administrative officers," and the like commonly have in American law peculiar meanings dependent on the connection in which the phrases are used, and on other provisions of law necessary to be considered with them.

(c) A policeman, constable, or bouncer.

character of an ancient Celtic alphabet, the

so called; traditionally ascribed to a mythical
inventor named Oghma, whose name is reflected
in the W. ofydd (> E. wate²), a man of letters or
science, philosopher, and in the Gr. Oghma, the
name, according to Lucian, of a deity of the
Gauls, represented as an old man who drew after
him a crowd of followers by means of chains
connecting their ears with the tip of his tongue,
i. e. by power of speech; prob. (Rhys) orig. =

drive, lead, draw; see act, agent, etc.] 1. A
character belonging to an alphabet of 20 letters
used by the ancient Irish and some other Celts in
the British islands. An ogham consists of a straight
line or a group of straight lines drawn at right angles to
a single long stem or main line of writing, and either con-*

finned to the one or to the other side of this stem or inter-
secting it. Some of the lines make an acute angle with
the stem. Curves rarely occur. The oghams were cut or
carved on wood or stone, and some have come down to
us in manuscripts. In lapidary oghamic inscriptions the
edge of the stone often served as the main stem. Oghams
continued to be used till the ninth or tenth century in
Ireland as secret characters.

2. An inscription consisting of such characters.

Here he cut four wands of yew, and wrote or set an

such characters.

pagan, but in reality it was no more so than the Roman
alphabet. *J. Rhys, Lect. on Welsh Philology*, p. 358.

The Ogham writing, as I have elsewhere shown, was
simply an adaptation of the runes to xylographic con-
venience, notches cut with a knife on the edge of a squared
staff being substituted for the ordinary runes.
Lower Taylor, *The Alphabet*, II, 225.

ing, which was likewise called ogham.

oil-distributor (oil' dis-trib' ū-ter), *n.* Any device or appliance used for the distribution of oil over the surface of the sea for smoothing waves and thus obviating their destructive effect. The first appliance for this purpose, which aimed at economy in the use of oil, was a porous oil-bag attached to a rope, thrown overboard, and towed from the end of a "pat or out-

rigger, the oil slowly filtering through the pores. This has been followed by a variety of inventions, comprising oil-bags placed in water-chest pipes, and devices for distributing oil when towed by a vessel. The oil-distributor of M. Gaston Mender employs a pump discharging water at the water-line, through a series of outboard pipes, the pump also taking oil from a receptacle, and mingling it with the water discharged. The rate of expenditure of oil is indicated by a glass gage, and is regulated by a valve. The oil-distributor of Captain Townsend of the United States Signal Office consists of a hollow metal globe ten inches in diameter, which holds about 14 gallons of oil, and is kept afloat and held in a nearly fixed position relatively to the surface of the water by an air-chamber. The oil-chamber has an upper and a lower valve, both of which may be adjusted to permit water to flow in through the lower, and the oil displaced by the water to flow out through the upper valve, at a rate controlled by the adjustment. The oil acts mechanically by spreading over the surface of the sea in a tenuous film, which is sufficient to prevent the waves from breaking, and this takes from them their chief power for harm.

The fat is first carefully cleaned from adhering impurities, as bits of flesh, etc., and then thor-

oughly washed in cold water. Under great hydraulic pressure the parts which still remain fluid are pressed out; after a time these solidify and are ready for market. This substance has been largely used as an adulterant of butter. When oleomargarin is churned in a liquid state with a certain proportion of fresh milk, a butter is produced which mixes with it, while the buttermilk imparts a flavor of fresh butter to the mass, making an perfect an imitation that it can scarcely be distinguished by taste from fresh butter. (*Y. Egan*, *olive-oil*, oil; see *oil*.) I, *v.* 1. The oil-tree, *Olea europaea*, cultivated from the earliest times in Syria and Palestine, and thence in remote antiquity distributed throughout the whole Mediterranean region; in recent times it has been successfully planted in Australia, southern California, and elsewhere. The olive is of low stature (some 40 feet) with rounded top, the trunk and branches are apt to be gnarled and fantastic, and the leaves are small and lance shaped, dull-green

above and silvery beneath; the general effect is that of an old willow. It is a vigorous tree of great longevity and productivity, and thrives in poor and dry calcareous and sandy soils. Of the cultivated variety (*O. sativa*) some twenty or thirty subvarieties are recognized. The wild variety (*O. Oleaster*) has short blunt leaves, the branches more or less spiny, and a worthless fruit. It is native in southern Europe as well as Asia. The olive was anciently sacred to Pallas, and its leaves were used for victory wreaths among the Greeks and Romans. (*See Olive branch*.) The value of the olive lies chiefly in the fruit, but its wood also is valuable. *Olivorum* or *Leva gum* (*oliva*) exudes from the bark, and was formerly used as a stimulant, while the bark itself has served as a tonic.

2. The fruit of the common olive-tree, a small ellipsoid drupe (the "berry"), bluish-black in color when fully ripe. It is an important source of oil (see *olive oil*) and is also largely consumed in the form of preserved or pickled olives, consisting of the green-colored unripe drupes, first soaked in water containing potash and lime to expel bitterness, and then bottled in an aromatized salt liquid.

3. A tree of some other species of *Olea*, or of some other genus resembling the olive. See *Olea*, and phrases below.—4. It is widely distributed in North America, and is one of the common thrushes of the eastern parts of the United States, like the wood thrush, hermit thrush, and veery. Thy wife shall be as the fruitful vine upon the walls of thine house: thy children like the olive branches ("olive-plants" in the authorized version) round about thy table.

olive-nut (ol'iv-nūt), *n.* The fruit of species of *Elaeagnus*.

olive-oil (ol'iv-oil'), *n.* A fixed oil expressed from the pericarp or pulp of the common olive. It is an insipid, inodorous, pale yellow or greenish-yellow, viscid fluid, unctuous to the feel, inflammable, incapable of combining with water, and nearly insoluble in alcohol. It is the lightest of all the fixed oils, and is of the non-drying class. It is very largely used as a food. In countries where it is produced it is employed in cookery and serves as butter with bread. In England and America its chief use is chiefly that of a salad dressing. In medicine it is employed principally in liniments, ointments, and plasters. Inferior grades serve for lubrication, illumination, wadding, dressing, and soap making. For the best oil the fruit should be picked just before it is ripe enough to fall, and ground at once. The first pressing, without application of water or heat, yields *crown oil*. The second pressing, after subjecting the marc to the action of boiling water, is not quite so good, a third yields the inferior *pressed oil*. Olive-oil is extensively adulterated with cotton seed, arachis, and other oils. Italy leads in the production and export of olive-oil. Also called *sweet-oil*.

The festival began with sacrifices, followed by contests in racing, wrestling, etc., and closed on the fifth day with processions, sacrifices and banquets to the victors. The victors were crowned with garlands of wild olive; and on their return home they were received with extraordinary distinction, and enjoyed

'ausis, ear; see *auscultate* and *auris*), + *men*, a common suffix.] A casual event or occurrence supposed to portend good or evil; a sign or indication of some future event; a prognostic; an augury; a presage. See *augur*.

I see now by this inversion of my Armour that my buckled up will be turned into a King's. Taking that for a good Omen, which some other of weaker spirits would have taken for a bad.
Baker's Chronicle, p. 22.

Ah, no! a thousand cheerful omens give
Hope of yet happier days, whose dawn is nigh.
Bryant, The Ages, viii.

Syn. *Omen*, *Portent*, *Sign*, *Presage*, *Prognostic*, *Augury*, *Foreboding*. *Omen* and *portent* are the most weighty and supernatural of these words. *Omen* and *sign* are likely to refer to that which is more immediate, the others to the more remote. *Omen* and *portent* are external; *presage* and *foreboding* are internal and subjective. The others are either internal or external. *Sign* is the most general. *Prognostic* applies to the prophesying of states of health or kinds of weather, and is the only one of these words that implies a

deduction of effect from the cultivation of causes. *Presage* and *augury* are generally favorable, *portent* and *foreboding* always unfavorable, the rest either favorable or unfavorable. *Omen* and *augury* are most suggestive of the ancient practice of consulting the gods through priests or augurs. A *foreboding* may be mistaken; the others are presumably correct. All these words have considerable freedom in figurative use. See *foretell*, *v. t.*

omen (ô'men), *n.* [*< Omen*, *n.* (*cf.* *ominate*).] *I. intrins.* To prognosticate as an omen; give indication of the future; augur; betoken.

omental (ô-men'tal), *a.* [*< Omentum* + *-al*.] Of or pertaining to the omentum; as, an *omental* fold of peritoneum; an *omental* gland.—**Omental foramen**, the opening from the greater to the lesser cavity of the peritoneum, commonly called *foramen of Winslow*.

omentocoele (ô-men'to-sel), *n.* [*< L.* *omentum*, *q. v.*, + *Gr.* *κωλη*, tumor.] Hernia of the omentum; same as *epiplocele*.

omentum (ô-men'tum), *n.* [*pl.* *omenta* (-tâ).] [*L.*, adipose membrane, the membrane inclosing the bowels, etc.] In *anat.*, a fold or duplication of peritoneum, of two or four peritoneal layers, passing between or hanging down from certain abdominal viscera—the stomach, liver, spleen, and colon. An omentum is a structure similar to a mesentery, and is in fact a special mesentery connecting the stomach with the liver, spleen, and colon respectively. Hence omenta are commonly distinguished by name. The *gastro-hepatic* or *lesser omentum*, *omentum minus*, is a single fold (two layers) of peritoneum extending between the transverse fissure of the liver and the lesser curvature of the stomach. In two of the two layers are the hepatic artery, portal vein, bile duct, and *splanchnic* structures, bound together by a quantity of loose connective tissue forming Gibson's capsule. The *gastro-splenic omentum*, of two layers, connects the convexity of the spleen with the fundus of the stomach, and contains the splenic vessels. The *gastro-colic* or *great omentum*, *omentum majus*, also called *epiploon*, is the largest of all the peritoneal duplications and consists of two layers of peritoneum attached to the greater curvature of the stomach and to the transverse colon, whence it is looped down freely upon the intestines, forming a great flap or apron.

operameter (op'-e-ram'-e-ter), *n.* [*L.* *opera*, work, + *Gr.* *μέτρος*, a measure.] An instrument for indicating the number of movements made by a part of a machine, as the turns made by a shaft, the oscillations of a working-beam, the delivery of sheets from a printing-press, or the reciprocations of a cross-head, etc., in a stated interval of time. The principles of construction are various. A common form has a ratchet-wheel connected with registering-dials, and an oscillating lever which by suitable mechanism is made to take up a single ratchet-tooth at each to-and-fro movement of a reciprocating or oscillating part, such as the cross-head of a steam-engine. Another form has a spear-pointed spindle which is connected with a registering mechanism, the whole implement being held in the right hand, and the point of the spindle being pressed into the center at the end of the shaft whose revolutions are desired to be counted. Also called *counter*, *speed indicator*, and *revolution indicator*. See *arithmometer*.

3. The course of action or series of acts by which some result is accomplished; process. (*a*) *In surg.*, the act or series of acts and manipulations performed upon a patient's body, as in acting a bone, amputating a limb, extracting a tooth, etc.

While Gersdorff, of Strasburg, probably had used the ligature in amputation wounds for some years it remained for the genius of Pare to give to amputations a comparatively firm position among surgical *operations*.

Buck's *Handbook of Med. Sciences*, I. 14.

(*b*) *In math.*, the substitution of one quantity for another, or the act of passing from one to the other, the second quantity being definitely related to the first either in value or in form. An *operation* must not be confused with the *process* by which the operation is effected. Thus, there is but one operation of extracting the cube root of a number, but there are several different processes. (*c*) *In war*, the act of carrying out preconcerted measures by regular movements, as military or naval *operations*.

4. The state of being at work; active exercise of some specific function or office; systematic action: as, the machine is in *operation*.—5. Method of working; action.—6. Power exercised in producing an effect; peculiar efficiency of action; characteristic property or virtue.

Shak., *2 Hen. IV.*, IV. 3. 104.

Something that hath the *operation* to

Make death look lovely.

Mantuan, *Benvenuto*, v. 6.

Not only the fabrication and take making of the whole of a written instrument, but a fraudulent insertion, alteration, or erasure, even of a letter, in any material part of a true instrument whereby a new *operation* is given to it, will amount to forgery—and this though it be afterwards executed by another person ignorant of the deceit.

Russell, *Crimes and Misdemeanors*, II. 619, quoted in *Encyc. Brit.*, IX. 412.

74. Impulse; tendency to act.

There are in men *operations* natural, rational, supernatural, some political, some finally ecclesiastical.

Hooker, *Eccles. Polity*.

I have *operations* which be humours of revenge.

The form is often slenderer than in a common eel, the posterior nostrils are labial, that is, on the margin or even the inside of the upper lip, and the tongue is attached to the floor of the mouth. In some species the tail is conical or fusiform, in others it is surrounded by a fin, as usual in eels, whence the two subfamilies *Ophichthyinae* and *Myxinae*. Several genera are found in the waters of the southern and Pacific coasts of the United States.

Ophicleide (ô-fî-kî-de), *n.* [*Gr. ôphis*, a serpent, + *klêre* (*klêre*), a key; see *clave*.] A metal musical wind-instrument, invented about 1740, having a large tube of conical bore, bent double, with a cupped mouth-piece. It is essentially a development of the old wooden serpent, and has sometimes been made partly of wood. It is the bass representative of the keyed bugle family. The tones produced are the harmonies of the tube, as in the horn; but the fundamental tone may be altered by means of keys which control vents in the side of the tube. Eleven such keys are employed, so that the entire compass is over three octaves, beginning (in the usual base variety, on the third C below the middle C) with all the semitones, all obtainable with exceptional accuracy of intonation. Its resources are therefore considerable and as its tone is highly resonant and pungent it is an important orchestral instrument. The ophicleide is pitched a fifth higher than that described above, while lower varieties also occur.

The name was introduced to replace *Serpentes* of *Linnaeus*, and at first included not only serpents in a proper sense, but certain footless lizards, and even the ophiophobians of the family *Ophioides*. In *Ophidia* proper there is never any trace of

force limbs, and at most very rudimentary limbs, represented externally by more anal spurs or processes of the integument. There is no sterneum. The ribs are very numerous, and are arranged as to become indirect organs of locomotion by their action upon the skin and so on the scales of the belly. The vertebrae are procoelous, very numerous, not united in any sacrum and bearing no chevron bones. The skull has no quadratoangular arch nor parietal foramen, the lower jaw is articulated with a movable quadrate bone, and its ramus are connected only by fibrous tissue. The bones of both jaws are generally freely movable, so that the mouth is enormously distensible. The tongue is slender, forked, and protrusile, subserving a tactile office. Teeth are present in one of both jaws, usually in both, they are numerous and sharp, and in venomous *Ophidia* some of the upper ones, usually a single pair, are enlarged, hooked, grooved, or apparently perforate, and thus converted into poison-fangs. The eyes have immovable lids, the eyelids extending directly over the eyeball. The mouth is usually forming many very regularly arranged rows of scales on the upper part, and usually larger modified scales on the under side, called *mentals* and *mentals*, serving in some extent for locomotion. There is a pair of extracocular pores in the male; the female is copious or ovoviviparous. *Ophidia* are variously subdivided by *Duméril* and *Bisson* into *Ophiocrotalia*, *Aspidocrotalia*, *Proterophyllophaga*, and *Solenophyllophaga*, an arrangement substantially now current, though with some modifications. *Cope's* latest arrangement is *Ophiocrotalia*, *Crotalia*, *Loricaria*, which are *Ophiocrotalia*, *Antennae*, which are *Ophiocrotalia*, *Proterophyllophaga*, and *Solenophyllophaga*. There are 20 families and about 300 genera, of which more than 200 belong to the family *Crotalidae* alone. See also cut under *Psalm*.

(2) *In Günther's* system they are a family of eel-like fishes corresponding to the modern *Ophichthyidae*. There is but one species, *O. parviflorum*, the snake-nut-tree, native in Guinea, a lofty tree bearing alternate pinnate leaves, panicles of many very small flowers, and roundish one-seeded drupes containing a spirally twisted snake-like embryo. The natives are said to believe that these are transformed into venomous serpents.

Ophiocephalidae (of'i-o-sef'ā-lī-de), n. pl. [NL., < *Ophiocephalus* + -idae.] A family of fishes, typified by the genus *Ophiocephalus*; the walking-fishes. They have a long acylindrical body covered with small scales, and a snake-like head shielded on top with large scales, a long spinous dorsal fin, and usually six rayed thoracic ventrals. These remarkable fishes breathe air by means of an air chamber developed over the gills, and die if they breathe water too long. They live in holes in the banks of rivers and pools and similar wet places, and often burrow in the mud. There are 25 or 30 species, natives of the fresh waters of the East Indies and Africa, and some attain a length of from 2 to 4 feet. They are able to survive droughts, living in some fluid mud or lying to the bottom of the hard baked crust of a tank or pool from which every drop of water has dried up. Respiration is probably suspended during this torpidity, but while the mud is still soft enough to let them come to the surface they rise at intervals to breathe air. This faculty of aerial respiration is due to the development of the accessory branchial chamber; there is, however, no accessory branchial organ, and the opening of the cavity is partly closed by a fold of mucous membrane.

The *O. pakuha* (the *coramunda* or *pakuha* of India) is much used for food by the natives. It is generally brought to market and cut up for sale while living. Also, improperly, *Ophiocephalus*. the leaves are not circinate in vernation, and the sporangia, which are endogenous in their origin and without annulations, are never on the under side of the green frond. They differ further from the true ferns by the absence or imperfect formation of bundle-sheaths and sclerenchyma in the stems and leaves. The *Ophioglossaceae* embrace 3 genera, *Ophioglossum*, *Helminthoglossum*, and *Bolophium*.

It is known to attain a length of nearly 12 feet, and is said to reach 15 feet. Its bite is fatal to man in a few moments, and it is said to be able to kill very large quadrupeds. This serpent is found in India and some of the East India islands, as Java, Sumatra, and Borneo, but is fortunately not so common as the ordinary cobra. The generic name refers to its habit of feeding upon other snakes.

See *poppy* and *Papaver*. The opium exudes as a milky juice from shallow incisions made in the partly ripened capsules or heads still on the plant. It soon thickens as collected by scraping, and kneaded into a homogeneous mass, forming then a reddish-brown sticky gum like substance of bitter taste and peculiar odor. Opium was known to the Greeks, but was not much used before the seventeenth century; at present it is the most important of all medicines, and its applications the most multifarious, the chief of them being for the relief of pain and the production of sleep. Its habitual use is disastrous and difficult to break up. It is classed as a stimulant narcotic, acting almost exclusively on the central nervous system when taken internally. In large quantities it is a powerful narcotic poison, resulting in a coma characterized by great contraction of the pupils, insensibility, and death. The chief active principle of opium is morphia, but it also contains at least seven other alkaloids, some of which have similar properties. (See *narcotine*.) Though opium can be produced in Europe, the United States, etc., its commercial production is limited to countries where labor is cheap and the drug in common use, namely Turkey, Persia, Egypt, India, and China. The Western market is supplied largely from Asia Minor. The Indian export goes chiefly to China.

opossum (ô-pos'um), *n.* [Formerly also *opasum*; also, and still in rural use, *abbr.* *possum*, formerly *possum*; Amer. Ind.] 1. An American marsupial mammal of the family *Didelphidae* (which see for technical characters). They have the four kinds of teeth which carnivorous quadrupeds regularly possess (incisors, canines, premolars, and molars), and are omnivorous eating flesh and carrion, reptiles, insects, and fruits. The head is conical, and the mouth somewhat resembles that of a pig; the ears are large, lanky, and rounded; the eyes are small; the whiskers are long; the legs are of proportionate length; both fore and hind paws are five-toed, fashioned like hands, especially the hind ones, which have an opposable thumb; and the tail is generally long, scaly, and prehensile, so that the animal can hang by it. The pelage is coarse; the body is stout, and in size ranges from that of a large cat to that of a small rat. Most female opossums have on the belly a pouch containing the teats, into which the young are received as soon as they are born. They are born extremely small and imperfect. The Virginia opossum has 12 teats, and no doubt may have as many young at a birth, but the number is usually less. Opossums are nocturnal animals; they move on the ground rather slowly and awkwardly, but are more at home in trees, and some of the species are aquatic. Though they are uncleanly, the flesh is white and palatable, especially in the autumn, when they feed much on fruits and become as fat as pigs. They can usually appear stupid, and in confinement continue sullen and intractable. When caught or threatened with danger they feign death, and will submit to the most brutal maltreatment without showing a sign of submission, whence the proverbial expression "to play possum." Most opossums belong to the genus *Didelphis*, ranging from middle latitudes in the United States through the greater part of South America. The commonest and best known is *D. virginiana*. There are perhaps a dozen others, among them *possum* *mus*, as *D. douglasi*. The yapoks or water-opossums of South America form another genus, *Chironomys*.

Amongst the Beasts in Virginia there are two kinds most strange. One of them is the Female *Possum*, which

Common Opossum (*Didelphis virginiana*)

hath a bag under her belly, out of which she will let forth her young ones, and take them in again at her pleasure. The other is the flying Squirrel.

(b) The angle which the visual axes of the eyes make with one another as they tend to meet at some distance before the eyes. (c) The angle between the optic axes in a bial crystal.—**Optic axis.** (a) See *axis*. (b) The line in a doubly refracting crystal in the direction of which no double refraction occurs. Crystals belonging to the tetragonal and hexagonal systems have a single optic axis, coincident with their vertical crystallographical axis; hence they are said to be *uniaxial*. Crystals belonging to the orthorhombic, monoclinic, and triclinic systems have two optic axes, and hence are *biaxial*.—**Optic chiasm.** In *anat.*, the commissure, decussation, or chiasm of the right and left optic nerves. See *chiasm*, and cuts under *brain* and *corpus*.—**Optic commissure.** Same as *optic chiasm*.—**Optic cup.** A concave or cup-like area formed by the invagination of the distal extremity of the primary optic vesicle.—**Optic disk.** The slightly oval area on the retina formed by the entrance of the optic nerve. It is somewhat elevated, and is also called the *optic papilla, colliculus nervi optici*, and *porus opticus*.—**Optic foramen.** See *foramen*.—**Optic ganglia.** The corpora quadrigemina or bigemina.—**Optic groove.** The groove lodging the chiasm on the upper surface of the sphenoid bone, in front of the olivary eminence.—**Optic lobes** (lobi optici), the dorsal part of the midbrain or mesencephalon. The lobes are paired, right and left, and hence called *corpora bigemina*, in animals below mammals.

In man and other mammals each lobe is also marked by a cross-furrow, so that the two lobes form four protuberances, whence they are called *corpora quadrigemina*, and consti-

into what are called in human anatomy the *optic nerves* and *optic chiasm*. The optic nerves arise in part from the optic lobes. These important lobes decrease in relative size as the vertebrate scale ascends; thus, in some fishes they are quite as large as the cerebral hemispheres, and in some mammals they are small in proportion both to the cerebrum and to the cerebellum, and entirely covered in, so that they do not appear upon the surface of the brain. See cuts under *nerve* and *corpus*.—**Optic nerves** (nerve optically), the nerves of sight; the nerves of the special sense of vision, arising from the anterior quadrigeminal and external geniculate bodies and the pulvinar, and terminating in the retina. These nerves are purely sensory, and by means of them the retinal stimulations affect the brain—a process by which vision is accomplished. The optic nerves of opposite sides decussate or form the optic chiasm, and the phrase is sometimes restricted to the part of these nervous trunks beyond the chiasm, the rest being called the *optic tract*. See cuts under *brain*, *corpus*, and *eye*.—**Optic neuritis**. See *neuritis*, and cuts under *corpus* and *eye*.—**Optic pad**, a pad like elevation at the end of the arms of a starfish on which an eye is situated.—**Optic papilla**. Same as *optic disk*.—**Optic peduncle**, in crustaceans, an eye-stalk or ophthalmite.—**Optic stalk**, in mollusks, a soft process of the head upon which the eye is supported, as in various snails, etc.; an ommatophore. See *Stylomatophore*.—**Optic thalamus**, a large ganglion of the thalamencephalon, situated upon the crus and separated from the lenticular nucleus by the internal capsule. It gives origin to some of the fibers of the optic nerve. Also called *thalamus*. See cuts under *corpus* and *corpus*.—**Optic tract** (tractus opticus), the part of the whole course of the optic nerves which is between the chiasm and the respective origins of the nerves. In man the tracts are narrow flat bands of white nerve-tissue crossing the crus, to which they are closely attached.—**Optic tubercles**, the corpora quadrigemina. See *Hygema*.—**Optic vesicles**, in *echinodermata*, a pair of vesicles developed from the anterior cerebral vesicles of the embryonic brain.—**Syn. Optic**, *Optical*. The former is chiefly said of the anatomy of the eye and of the physiology of vision, the latter chiefly of the science of optics—*as*, *optic nerve*, *tract*, *lob*, *optical angle*, *center*, *effect*.

II. n. 1. The eye. [Now chiefly colloq.]

Quickly add Indifference will cause

optical (op'ti-kal), *a.* [*Optic* + *-al*.] 1. Relating to or connected with the science of optics; based on or constructed in accordance with the laws of optics: *as*, *optical laws*; *optical instruments*.—2. Pertaining to vision; optic.—3. Treating of or studying optics; *as*, *optical writers*. Boyle, *Works*, I. 673. **Optical anomaly**. See *anomaly*. **Optical center**, in a lens, a point *o*, stated that the direction of every ray passing through that point remains unaffected by its transmission through the lens—that is, the incident and emergent parts of the ray are parallel. Geometrically it is defined as the point in which the optical axis of the lens is cut by the line joining the two points where any pair of parallel planes touch the opposite surfaces of the lens. In a double-convex or double-concave lens the optical center lies within the lens; in a plano-convex or plano-concave lens it is in the point where the curved surface of the lens is pierced by the axis; in the meniscus and concavo-convex it lies outside of the lens, beyond the surface which is most strongly curved. If the thickness of the lens is small compared with its focal length, the dimensions of object and image will be very nearly proportional to their distances from the optical center. Combinations of several lenses do not possess an optical center. **Optical circle**, in physics, a graduated circle, fitted with the necessary appliances, used for illustrating the laws of refraction and reflection, or, when accurately constructed, for measuring interfacial angles, refractive indices, etc.—**Optical densimeter**, equation, glass, meteorology, square, etc. See the noun.—*Syn.* See *optic*.

See *geometric*. **Physical optics**, that branch of optics which includes the phenomena of diffraction, interference, double refraction, and in general that division of the subject which is explained by reference to the undulating theory and the behavior of light-waves under various conditions.—**Physiological optics**, that branch of physiology which treats of the eye and the sight-function.

optigraph (op'ti-graf), *n.* [*Gr. ὀπτικός, of seeing*, + *γραφία, write*.] A form of telescope constructed for the purpose of copying landscapes, etc. It is suspended vertically in gimballs by the object-end, beneath a fixed diagonal plane mirror, which reflects the rays from the objects to be drawn through the object glass of the instrument to a speculum, and thence through the eye-glass to the eye. Between the eye and the speculum is a piece of parallel glass with a small dot on its center, exactly in the focus of the eye-glass. This dot is made to pass over the outlines of an object, and a pencil fixed at the eye end traces the delineation on paper.

optimism (op'ti-miz-m), *n.* [*F. optimisme* = *Sp. Pg. optimismo* = *It. ottimismo* = *G. optimismus*, *very good*, best; see *optimum*.] 1. In metaph.: (a) Properly, the metaphysical doctrine of Leibnitz that the existing universe is the best of all possible universes. The most characteristic moments of the doctrine are two: first, that the Creator selected this universe from a number of others which he might have created, and second that all of these presented certain imperfections or disadvantages which omnipotence could not avoid. (b) The doctrine that the universe advances on the whole, so as to be tending toward a state in the indefinite future different in its general character from that in the indefinite past. This is better called *evolutionism*. It is opposed to *pantheism*, which holds that the universe is tending to the nothingness from which it springs, and to *epicurism*, which holds that the universe is not tending from any general state to any other general state. 2. The belief, or disposition to believe, that whatever exists is right and good, in some inscrutable way, in spite of all observations to the contrary.

The Christian optimism is the recognition that in a spiritual world a spiritual being, as such, cannot find an absolute limit or foreign necessity, against which his life must be broken in pieces; but that, on the contrary, all apparent outward limits, and even death itself, are for it but the means to a higher freedom and realization of self.
E. Caird, *Illeg.*, p. 217.

It seemed to chill the flow of the good fellow's optimism, so that he assented with but lukewarm satisfaction.

(associated with *bonus*, good), *√ op* in *optare*, choose; see *optate*.] In bot., one of the three cardinal points of temperature—namely that point at which the metabolic processes are carried on with the greatest activity. The minimum or zero point is the point at which the performance is just possible, the optimum point, at which it is carried on with the greatest activity, and the maximum point, at which it is arrested. (Clim.)

Every vegetative (and fructificative) process has certain limits of temperature, and a fixed optimum in each species.

The first kind of option is usually designated a *call*, and the second a *put*, but both are sometimes called *futures*.

Layman's Def. of Christ (1749), p. 23.

Buyer's option. See *buyer*. **Local option**. See *local*. **Seller's option**. See *seller*. **Syn.** 1. Option, Choice, Preference, Election. Option is the right of choice, the freedom to choose between two or more; *as*, "there is no option," Rhod, *Hamlet*, p. 30. Choice is primarily the act of choosing, but, by extension, may be the same as option; *as*, he gave him the choice. Preference is primarily the state of mind determining the choice, and sec-

culo, *L. oraculum*, synecopated *oraculum*, a divine announcement, a prophecy, a place where such were given, *Cf.* *orare*, pray: see *oration*.] 1. In *class. antiq.*: (a) An utterance given by a priest or priestess of a god, in the name of the god and, as was believed, by his inspiration, in answer to a human inquiry, usually respecting some future event, as the success of an enterprise or battle, or some proposed line of conduct. Such oracles exerted for centuries a strong influence upon the course of human affairs, the belief of both the medium and the questioner in their divine inspiration being in most cases genuine. The oracles themselves, however, were often ambiguous or at least obscure. The prestige of the chief oracular seats of Greece was powerful in the promotion of good government and justice. After the introduction of Christianity the utterance of oracles gradually ceased. It was a common belief of early Christians that the oracles actually proceeded from evil spirits.

Than what I know, yet shall the oracles
Give rest to the minds of others.

Shak., W. T. II. 1. 190.

Thither come,

And let my grave alone be your oracle.

Shak., T. of A., v. 1. 222.

(b) The sanctuary or most holy place in the temple, in which was deposited the ark of the covenant (1 Ki. vi. 19): sometimes used for the temple itself.

oratorio (or-a'to-ri-o), *n.* [*L. oratorio*, < L.L. *oratorium*, a place of prayer, an oratory or a chapel. The name was originally given to sacred musical works because they were first performed in the oratory of the church of St. Maria in Vallicella, under the patronage of Philip Neri: see *oratory*.] 1. A place of worship; a chapel; an oratory.—2. A form of extended musical composition, more or less dramatic in character, based upon a religious (or occasionally a heroic) theme, and intended to be performed without dramatic action and scenery. The modern oratorio and opera both date from the musical revolution in Italy, about 1600, and were originally indistinguishable from each other, except that one was sacred and the other secular in subject. Both employed the same musical means, such as recitatives, arias, duets, choruses, instrumental accompaniments and passages, and at first even dancing also (to which see *opera*), and both were dramatically presented. But before 1700, particularly in Germany, the oratorio began to be clearly differentiated from the opera, in the relinquishment of dramatic action and accessories, though not usually of dramatic personification, in the more serious and reflective treatment of both arias and choruses, and in the freer use throughout of contrapuntal resources. The oratorio, therefore, came to be regarded essentially to the class concert music, with more or less of the qualities of church music. The true oratorio style has never been popular in either Italy or France, but has had a remarkable development in both Germany and England. The strong predilection which existed before 1800 for passion plays led in Germany directly to the cultivation of what is called the *passion-oratorio* or *passion-music*, the theme being the passion and death of Christ, and the whole work being conceived from a decidedly liturgical standpoint. The most famous example of this style is the "Passion" according to St. Matthew of J. S. Bach. In England the works of Handel in the early part of the eighteenth century inflamed an interest in the concert oratorio which has been constant and wide-spread. The method of treatment of the English oratorio has varied considerably, from the epic and contemplative to the representative and dramatic, with more or less of the lyrical intermingled. While the oratorio style in general has seldom attained to the passionate intensity and complexity of the opera, it has outstripped the latter in the expression of the lofty spiritual emotions connected with religious thought. Its independence of theatrical limitations has made possible a far more free and elaborate handling of the chorus as a separate artistic means, so that most oratorios are essentially choral works. The oratorio has never occupied the same position of social importance as the opera, but it has perhaps contributed more to the world's store of new artistic conceptions.

Track; course; path, especially a path, as that in a circle or an ellipse, which returns into itself; specifically, in *astron.*, the path of a planet or comet; the curve-line which a planet describes in its periodical revolution round its central body or center of revolution; as, the orbit of Jupiter or Mercury. The orbits of the planets are elliptical having the sun in one of the foci, and they all move in these ellipses by this law — that a straight line drawn from the center of the sun to the center of any one of them, termed the *radius vector*, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. These are called *Kepler's laws* (see *law*). The attractions of the planets for one another slightly derange these laws, and cause the orbits to undergo various changes. The satellites, too, move in elliptical orbits, having their respective primaries in one of the foci. The parabolic and hyperbolic paths of comets are also called orbits. The elements of an orbit are those quantities by which its position and magnitude for the time are determined, such as the major axis and eccentricity, the longitude of the node and the inclination of the plane to the ecliptic, and the longitude of the perihelion. In the ancient astronomy the orbit of a planet is its eccentric, or the deferent of its epicycle.

3. In *anat.* and *zool.*, the bony cavity of the skull which contains the eye; the eye-socket.

In man the orbits are a pair of quadrilateral pyramidal cavities completely surrounded by bone, and separated from the nasal cavity and the cranial cavity with the cranial foramen, and opening forward upon the face, with the apex at the optic foramen where the optic nerve enters. Seven bones enter into the formation of each orbit, the frontal, sphenoid, ethmoid, maxillary, palatal, lacrimal, and malar, of which the first-named three are common to both orbits. Each orbit communicates with surrounding cavities by several openings, the principal of which are with the cranial cavity by the optic foramen and sphenoidal fissure; with the nasal fossa by the lacrymal canal; with the temporal and zygomatic fossa by the sphenomaxillary fissure, with ethmoidal parts by the anterior and posterior ethmoidal foramina; and with the face by supra-orbital, infra-orbital, extra-orbital, and malar foramina. The orbit contains the eye and its associated muscular, vascular, glandular, sustentacular, mucous, and nervous structures.

In *Diptera* the different parts of this border are distinguished as the anterior or facial orbit, the inferior or genal, the posterior or occipital, the superior or vertical, and the frontal, according to the regions of the head of which they form a part. Also called *temporomalar nerve*. — Orbital plate, (a) The os planum or smooth plate of the ethmoid bone, which in man, but not usually in other animals, forms a part of the inner wall of the orbit. (a) In theaters, in classic times, the orchestra was a circular or semicircular level space lying between the rising tiers of seats of the auditorium and the stage. In Greek theaters this space was *orchestra*, and was allotted to the chorus, which performed its evolutions about the thymele or altar of Dionysus, which occupied the center of the orchestra. Among the Romans the orchestra corresponded nearly to the orchestra of modern play-houses, and was set apart for the seats of senators and other persons of distinction. See *diagram under drama*. (b) In a modern theater or opera house, the place

assigned for the orchestra-players is usually the front part of the main floor. In the opera-house at Bayreuth the orchestra is below the level of the floor, so that the players are invisible to the audience. (c) The parquet.

2. In mod. music, a company of performers on such instruments as are used in concerted music; a band. (In the United States band usually signifies a military band; but in England band is interchangeable with orchestra.) The historic development of the orchestra as now known did not begin until about 1800, when the independent value of instrumental music was first generally accepted. Up to that time, though many instruments had been known and used, both alone and as supports for vocal music, they had not been systematically combined, nor had concerted music been written for them. The process of experiment, selection, and improvement in construction and mutual adaptation went on steadily until nearly 1800, when the orchestra first arrived at its present proportions. The instruments now used consist of four main groups: (a) the *strings*, including violins (first and second), violas, violoncellos, and bass violas, these together constituting the largest and decidedly the most important group, which is often used entirely alone, and is then called the *string-orchestra*; (b) the *wood wind*, including flutes, oboes, clarinets, English horns, basset-horns, bassoons, etc., these all being used both to enrich the effect of the strings, and in alternation with them to afford contrasts in tone-quality; (c) the *brass wind*, including French horns, trumpets, cornets, trombones, euphoniums, etc., these being also used both in conjunction and in contrast with the other groups, though their decidedly greater sonority makes their introduction necessarily more rare; and (d) the *percussion*, including tympani, snare and bass drums, cymbals, bells and triangles, harps, etc., and also sometimes the piano-forte, though the latter is seldom ranked as a true orchestral instrument. The proportions of the several groups are varied somewhat both by composers and by conductors. A full orchestra is one in which all these groups are present in fairly complete form; a small orchestra is one in which some important instruments are lacking. All the above instruments, except the harp, are essentially monophonic, and the peculiar artistic importance of the orchestra is based upon the fact that every element in the total effect is produced by a solo instrument in the hands of a separate performer. The orchestra is extensively employed both in accompanying vocal music of every kind and in purely instrumental works. Its unlimited capacities for varied effect have led to the production of an extensive musical literature, in which are some of the most famous specimens of musical art. The orchestra is an indispensable factor in all extended works like operas and oratorios. The maintenance of orchestras was originally undertaken by individual princes in the several European states; but they are now either attached to opera houses or supported by the proceeds of popular concerts.

It includes about 5,000 species, belonging to 348 genera, classed in 5 tribes and 27 subtribes. They are perennial herbs, some terrestrial, found both in the tropics and in colder regions, even to 68° N. lat., others epiphytes of tropical climates, reaching north to Florida. Their flowers are

generally beautiful and fragrant, often grotesque or imitating animal forms, and have three sepals, two similar petals, and a third petal, the lip, enlarged, and commonly of singular shape or color. Their pollen is coherent in a waxy or granular mass, usually transferred to the stigma only by insect-visits, insuring cross fertilization. They grow from short or creeping rootstocks, tubers, or thickened fibers, the epiphytic species commonly with a few lower joints of the stem thickened and persisting, forming a pseudo bulb. They bear undivided, often fleshy, parallel veined leaves, and one called capsules with a multitude of minute seeds. Any plant of the order is called an *orchid*.
